Comprehensive Chiroptical Spectroscopy

2 VOLUME SET

EDITORS:
Nina Berova, Department of Chemistry, Columbia University
Prasad L. Polavarapu, Department of Chemistry, Vanderbilt University
Koji Nakanishi, Department of Chemistry, Columbia University
Robert W. Woody, Department of Biochemistry and Molecular Biology, Colorado State University

978-0-470-64135-4 • 1,840 pages • Hardcover • December 2011
$395.00 US / $435.00 CAN / £263.00 / €315.00

This two-volume set provides comprehensive coverage of the most important and up-to-date methods dealing with polarized light, including their basic principles, instrumentation, and theoretical simulation for application to organic molecules, inorganic molecules, and biomolecules.

Comprehensive Chiroptical Spectroscopy is unique in providing complete, up-to-date, in-depth coverage of recent developments in frontier topics.

- Provides an extensive treatment of methods, instrumentation and applications, including frontier areas
- Describes theoretical methods and simulation methods applied to structure determination of organic molecules, metallo-organic and inorganic molecules, and biomolecules
- Presents the important applications of chiroptical spectroscopy to stereochemical and conformational analysis in organic and inorganic chemistry, biochemistry, and structural biology
- Includes chapters written by leading authorities with extensive experience in the field, presenting advantages and disadvantages of each technique, and comparing and contrasting the technique at hand with others
- Describes the roles of chiroptical methods in the study of drug mechanisms and drug discovery
- Provides the background needed for beginners, such as undergraduates and graduate students, and a state-of-the-art treatment for active researchers in academia and industry

ABOUT THE EDITORS

Nina Berova received her Ph.D. in chemistry in 1972 from the University of Sofia, Bulgaria, where she spent her early career and was promoted in 1982 to Associate Professor. In 1988 she joined the Department of Chemistry at Columbia University and is a Special Research Scientist and Adjunct Professor in the department. Her research is focused on the application of chiroptical spectroscopy in stereochemical analysis. She is the recipient of awards and visiting professorships in USA, Europe and Japan, and she has co-edited the International Journal of Chirality for Wiley since 1998.

Prasad L Polavarapu received his Ph.D. in 1976 from the Indian Institute of Technology, Madras. Following postdoctoral research at the University of Toledo and Syracuse University, he joined Vanderbilt University in 1980, where he is currently a Professor of Chemistry. He is the recipient of the 2010 Jeffrey Nordhaus Award for Excellence in Undergraduate Teaching in Natural Sciences and authored more than 200 research publications in chiroptical spectroscopy.

Koji Nakanishi Koji Nakanishi graduated from Nagoya University in 1947, and after spending 2 years at Harvard, received a Ph.D. in 1954 from Nagoya University. He taught in universities in Nagoya, Tokyo and Sendai before joining Columbia University in 1969. His research is in isolation and structural studies of natural products and mechanism of vision. He retired in 2007 but continues research. He is the recipient of many awards and honorary degrees.

Robert W. Woody received his Ph.D. in Chemistry in 1962 from the University of California at Berkeley. Following postdoctoral research at Cornell University, he was a faculty member at the University of Illinois, Urbana-Champaign, Arizona State University, and Colorado State University, where he is now an Emeritus Professor. His research centers on the structure and function of proteins and extensively utilizes spectroscopy, especially chiroptical spectroscopy. He has received numerous awards.
