Northern Lights

Jadasia P.

Brief: Jadasia’s research was inspired through her curiosity about the dazzling phenomenon known as Aurora Borealis.

The Northern Lights or aurora borealis are bright dazzling displays in the sky that occur when gaseous particles collide. They can be seen from many places on Earth but are visible nearly every night near to the North Pole. The South Pole has its own lights called aurora australis.

Acknowledgements: Jadasia would like to thank her mom and her teacher, Ms. Dalesandro.

About the Author: Jadasia is a second-grade student at Dan Mills Elementary School.
