Requirements for Graduate Students in the Vanderbilt
Psychological Sciences Program

I. Overview

This handbook outlines the requirements for graduate students in Psychological Sciences at Vanderbilt. Discussed are course requirements, milestones (e.g., the qualifying exam), and several additional issues related to the rights and responsibilities of graduate students. The development of an integrated program is an evolving process. Thus, this document will be periodically updated, based on changes that are approved by a vote of the Psychological Sciences faculty. It is the responsibility of the Directors of Graduate Study in the two departments to incorporate such changes into revisions of this document and to inform students and faculty about such revisions.

The requirements described in this handbook are applicable to all students who entered the Psychological Sciences program as first-year students in fall 2004 or subsequent years.

II. Areas of Specialization

Faculty members and graduate students are each associated with at least one of five areas of specialization (denoted as programs or areas in the sections below): Clinical Science, Cognition and Cognitive Neuroscience, Developmental Science, Neuroscience, and Quantitative Methods.

Faculty members from the Departments of Psychology and Psychology and Human Development can contribute to multiple programs. Graduate students are admitted to a specific college, department, and program. Typically, they receive financial support from their home department and college. A common set of core requirements applies regardless of departmental affiliation. Students must meet the requirements both for the graduate program in Psychological Sciences as a whole and for the specific area to which they belong.

III. Accreditation

The Clinical Science program in the Department of Psychology and the Department of Psychology and Human Development is fully accredited and approved by the American Psychological Association.¹

Vanderbilt University is accredited by the Commission on Colleges of the Southern Association of Colleges and Schools. Vanderbilt is a member of the Association of American Universities.

¹ Office of Program Consultation and Accreditation, American Psychological Association, 750 First Street NE, Washington, DC 20002-4242; phone: (202) 336-5500; website: http://www.apa.org/ed/accreditation
IV. Training Objectives and Mechanisms

The primary objective of graduate training is to promote the development of the necessary conceptual and methodological skills that will allow our graduates to function as independent scientists who conduct innovative and important research. Consistent with this goal, we expect our graduate students to be continually involved in research throughout their graduate training and to develop credentials that will establish a firm foundation for long-term contributions to the field.

Although a variety of means are used to promote the attainment of this objective, two distinctive mechanisms are particularly important. First, we expose students to a diverse array of experiences representative of the demands and challenges that they will confront in post-doctoral and employment settings. For example, we expect our students to be actively involved in research, the publication of articles, and the submission of grant proposals. Second, we use a one-on-one mentoring model of advisement (sometimes termed the "apprenticeship model") as a primary, though not exclusive, vehicle for the training of students. This model specifies that a critical component of training is the relationship between a student and a faculty mentor who is committed to that student's training and who works intensively and collaboratively with that student over time. The mentoring model is reflected in all phases of a student's education, from admissions through completion of the doctoral dissertation. Although the majority of students continue with one primary advisor throughout their tenure in the program, students can, and do, change advisors as their research interests evolve over time.

The majority of our graduates will accept positions that involve some degree of teaching. For this reason, an additional goal is training students how to teach effectively. Towards this end, the majority of our students serve as a teaching assistant at some point during their graduate careers.

V. Financial Support

All students receive financial support. Several mechanisms of support are used, including service-free fellowships provided by Vanderbilt University, research assistantships on funded research projects, fellowships provided by training grants, and teaching assistantships. Supported students receive a monetary stipend, tuition remission, and health benefits. All financial support is contingent on the student's continuance in good standing. At the present time, all students in good standing are guaranteed financial support during their first five years of training. The great majority of students have been supported throughout their graduate tenure.

Students are generally encouraged to submit a grant proposal to help support their research at some point during their residence in our program. This could be a federal grant or a private foundation grant. In addition, small grants to support research by graduate students are available from Vanderbilt University. Students can also apply for
funds to facilitate travel and attendance at conferences or other scientific meetings. Additional details about such funds are available from the Directors of Graduate Studies and the staff members who serve as their primary assistants.

VI. General Requirements

A. Course Requirements

The annual Graduate School Bulletin contains the complete list of graduate courses in psychology. Those specific courses that are taught in a given year are listed in the Schedule of Courses that is circulated prior to each semester. At the present time, classes are listed separately by department (Psychology or Psychology and Human Development) in both sources, with the location of the listing determined by the home department of the instructor. When specific courses are indicated below, we will note both the course number and the department in which it is currently taught (A&S = Arts & Sciences Psychology; P = Peabody Psychology and Human Development).

Grades in courses that are less than a C- are considered failing. Grades of B- or below are considered cause for concern. A student must attain a grade of C or better in order to receive credit for fulfillment of the requirements below, although instructors may impose a higher minimal threshold in specific cases. All students enrolled in a given class will be explicitly informed about the minimal grade required for satisfactory completion of that class.

The course requirements applicable to all graduate students irrespective of area of specialization are as follows:

1. Statistics: The two courses that make up the first-year statistics sequence (6 credits). In the fall, either PSY 6104-A&S [Formerly PSY304b-A&S] (Quantitative Methods and Experimental Design) or PSY-GS 8861-P (Statistical Inference)[Formerly 310-P] is required. In the spring, either PSY-GS 6104-A&S (Quantitative Methods and Experimental Design) [Formerly 304b-A&S] or PSY 8864-A&S (Experimental Design) [Formerly PSY 311-A&S] is required. During the past several years, the specific sequence has been PSY-GS 8861-P (Statistical Inference)[Formerly PSY-GS 310-P] and PSY 6104-A&S (Quantitative Methods and Experimental Design) [Formerly 304b-A&S]. In rare cases, based on a diagnostic test given at the beginning of the fall semester, a first-year student may be advised to enroll in PSY-GS 8858-P [Formerly PSY-GS 309-P (Introduction to Statistical Inference)], an introductory statistics class designed for students who lack an appropriate undergraduate background in statistics. Once 8858-P is satisfactorily completed, the student is expected to fulfill the introductory sequence (e.g., PSY-GS 8861-P/PSY 6104-A&S) noted above.

2. Research Seminar: A research seminar PSY 6300-A&S [Formerly PSY 300a-A&S (Research Seminar)] for A&S students, PSY-GS 8500-P [Formerly PSY-GS 396-P (Seminar in Psychology)] for Peabody students taken in the
fall semester of the first year. This seminar meets once per week. Core competencies of a successful scientist include scientific knowledge, research skills, communication skills, teaching, professionalism, and responsible conduct of research. This course will provide part of your introduction to each of these core competencies that will further develop as you progress through your graduate and postdoctoral training.

3. Breadth Requirement: One course from three of the areas of specialization listed below (9 credits total). One of the selected areas can correspond to the student’s area of specialization. Appendix A lists the specific courses offered in each area of specialization that can be used to fulfill this requirement. Although some courses are listed under more than one area of specialization, a given student can only count a given class within one category. Furthermore, a course that fulfills a specific area group requirement in the student’s particular research area cannot also be used to satisfy the breadth requirement in a different area (e.g., Cognitive Neuroscience can be used to satisfy the core requirement in the Neuroscience area but it cannot also be used as a course from the Cognition and Cognitive Neuroscience area to satisfy the breadth requirement as well).
   a. Clinical Psychology
   b. Cognition and Cognitive Neuroscience
   c. Developmental Psychology
   d. Neuroscience/Physiological Psychology
   e. Perception
   f. Personality and Individual Differences
   g. Quantitative Methods and Evaluation
   h. Social Psychology

Specific area groups may require further coursework in addition to those required at the departmental level. See below for a description of the additional requirements in specific area groups.

B. Research Requirements and Milestones
As described above (see Section IV), the scientific training of our graduate students is the highest priority. Accordingly, we expect all graduate students to be continually involved in research during their tenure at Vanderbilt. As graduate students progress through the program, we expect to see increasing levels of research productivity and increasing levels of intellectual independence. Research productivity is demonstrated by completing research projects, presenting at conferences, publishing papers, and applying for grants. Intellectual independence is demonstrated by developing a command of the relevant literature, formulating new ideas for experiments and analyses, and theoretically integrating empirical findings in novel ways.

In addition, there are several research requirements and milestones that serve to promote students’ development as scientists and to facilitate evaluation of progress. Specifically, all area groups: (1) evaluate students’ research progress and relevant knowledge of the field during their initial years in the program; (2) require students to pass qualifying
exams in order to advance to doctoral candidacy; and, (3) require students to satisfactorily complete a doctoral dissertation in order to receive the Ph.D degree. The specific nature and timing of these milestones (particularly the first two noted above) vary somewhat across area groups. Therefore, research requirements and milestones are described in the sections below that focus upon specific area groups.

Above and beyond these general milestones, the graduate student’s committee, in consultation with the relevant AGD and DGS, can specify specific milestones that the graduate student must meet.

**NOTE:** Many of these milestones are capped off by an oral defense meeting. Graduate students should try to avoid scheduling evaluation meetings during the first and second year, qualifying exam meetings, and doctoral dissertation defense meetings during summer months.

**C. Credits and Registration**

Students should be aware of Vanderbilt University requirements that are applicable to all graduate students. Specifically, receipt of the Ph.D. requires at least 3 years of academic graduate study, and completion of 72 hours of graduate work for credit with a minimum of 24 hours in formal course and seminar work. Generally, this minimum 24 hours does not include research or reading credits (e.g., 7031 [Formerly 331A] or 7032 [Formerly 331B], 7033 [Formerly 365], 7034 [Formerly 367], 7999 [Formerly 369], 8999 [Formerly 379], and 9999 [Formerly 399] in both departments), clinical practicum credits, or area colloquia (e.g., Seminar in Cognition and Cognitive Neuroscience, Seminar in Clinical Science, Seminar in Neuroscience). See the Bulletin of the Vanderbilt University Graduate School for additional details.

Students in the Department of Psychology (Arts & Science) are required to register for 12 credit hours per semester until they have completed the required 72 credit hours of graduate work. In the majority of cases (i.e., students who do not transfer credits from another institution), to fulfill this requirement A&S psychology students register for 12 credit hours per semester for the first three years of graduate study. Each semester, students typically should register for a variable number (0-12) of hours of research credit to make the total number of credit hours equal to 12 depending on their course load. First-year graduate students should register for PSY 7031-A&S [Formerly PSY 331-A&S (Fall)] or PSY 7032-A&S [Formerly PSY 331B-A&S (Spring)] (Advanced Investigational Techniques), second-year graduate students should register for PSY 7033-A&S (Second-Year Research) [Formerly PSY 365-A&S], and third-year graduate students should register for PSY 7034-A&S (Advanced Research in Psychological Sciences) [Formerly PSY 367-A&S].

Students in their fourth year and beyond who have not yet passed their qualifying examination (the MAP) should register for PSY 7999-A&S/PSY-G 7999-P [Formerly PSY 369-A&S] or PSY 8999-A&S/PSY-G 8999-P [Formerly PSY 379-A&S]. Students should enroll in PSY 7999-A&S/PSY-G 7999-P [Formerly PSY 369-A&S] (Master’s Thesis Research) if they have not yet reached their 72 credit hour limit and have not yet
passed their qualifying exam (the MAP); whereas they should enroll in PSY 8999A&S/PSY-G 8999-P [Formerly PSY 379-A&S] (Non-candidate Research) if they have reached their 72 credit hour limit but have not yet passed their qualifying exam (the MAP). Students who have passed their qualifying exam (the MAP) should register for PSY 9999A&S/PSY-G 9999-P [Formerly PSY 399-A&S] (Ph.D. Dissertation Research). When students have completed the required 72 hours, they should register for 0 credit hours of 8999 or 9999 (as appropriate) until the dissertation is successfully defended. Students should register for the minimal number of hours needed to exactly reach 72 hours when they arrive at that point in their program.

Except under exceptional circumstances, students should register for the summer session for 0 credits with the appropriate research course (e.g. PSY 7999-A&S [Formerly PSY 369-A&S]; see above). Summer tuition ($200) is covered by the source of money that supports the student, while the activity fees ($74) is the student’s responsibility.

Students in the Department of Psychology and Human Development are required to register for 9 credit hours per semester until they have completed the required 72 credit hours of graduate work. In the majority of cases (i.e., students who do not transfer credits from another institution), to fulfill this requirement students in Psychology and Human Development register for 9 credit hours per semester for the first four years of graduate study. When such students have completed the required 72 hours, they typically register for 0 credit hours.

Students who come to Vanderbilt with prior graduate experience at other institutions may be allowed to transfer graduate course credits in order to meet program, department, or university requirements. Such transfers require approval by the current instructor of the course and by the Director of Graduate Studies of the student’s home department. In order to facilitate decisions about credit transfers, students should present as much documentation as possible about courses taken elsewhere (e.g., course syllabi, examinations). Approved transfer credits will count toward the 72 hours of total graduate credits required, and in rare cases one or two courses may also count toward the required 24 hours of formal course and seminar work.

VII. Course and Research Requirements in Specific Area Groups

A. Clinical Science Area

The Clinical Science program offers doctoral education and training in clinical psychological science. The primary mission of the program is to educate clinical scientists who have the ability to make important, innovative contributions to scientific knowledge and the ability to function as skilled clinicians who use empirically validated assessment methods and treatment modalities. In addition to these core requirements common to all students, the program has sufficient flexibility to allow students to concentrate their training and to develop expertise in given areas that draw on the strengths of our faculty and the opportunities for research and clinical
training. Areas in which students can focus their training include psychopathology (including developmental psychopathology, adult psychopathology, developmental disabilities), clinical neuroscience, basic emotion processes, prevention and intervention, pediatric and adult health psychology, and quantitative analysis.

A.1. Course Requirements
In addition to meeting all general course requirements applicable to all graduate students in Psychological Sciences, Clinical students must pass the following courses. These courses will typically be taken during the first two to three years of graduate study:

1. Psychopathology (PSY-GS 8200-P) [Formerly PSY-GS 340-P]
2. Research Methods in Clinical Psychology (PSY 8310-A&S) [Formerly PSY 310-A&S]
3. Assessment
   a. Students must pass two of the following three courses:
      i. Cognitive Assessment PSY-GS 8300-P [Formerly PSY-GS 343-P]
      ii. Psychological Assessment PSY 8312-A&S [Formerly PSY 312-A&S]
      iii. Clinical Neuropsychology PSY 8354-A&S [Formerly PSY 354-A&S]
4. Theories of Psychotherapy (PSY 8315-A&S) [Formerly PSY 315-A&S]
5. Professional Ethics in Clinical Psychology (PSY 8353-A&S) [Formerly PSY 353-A&S]
6. Two additional classes in the following areas:
   a. Students must take two of the following three:
      i. An additional Psychopathology course
      ii. An additional Intervention course
      iii. An additional Assessment course
7. To fulfill APA distribution requirements, students must pass at least one course covering the current body of knowledge in each of the following areas, and demonstrate competence in each area by successful completion of the targeted course(s). Appendix B lists the specific classes that can be used to meet the requirements in each area.
   a. Biological aspects of behavior
   b. Cognitive bases of behavior
   c. Affective bases of behavior
   d. Human development
   e. Social bases of behavior
   f. Individual differences in behavior
   g. History and systems (this requirement is met through the distribution of content that is included in the core courses in the clinical science curriculum).

Additional APA distribution requirements for psychological measurement, research methodology, techniques of data analysis, psychopathology, and professional standards and ethics are met through courses that are required by
the Psychological Sciences program and/or the Clinical Science area group. APA distribution courses can also be used to fulfill departmental requirements.

8. All Clinical students must complete either four semesters of PSY 8360-A&S [Formerly PSY 360-A&S] (Seminar in Clinical Science, two semesters (not necessarily consecutive) of PSY-GS 8420-P [Formerly PSY-GS 349-P] (Seminar in Developmental Psychopathology), or two semesters (not necessarily consecutive) of PSY-GS 8420-P [Formerly PSY-GS 349-P] (Seminar in Intervention Research) during their graduate training.

A.3. Practicum Requirements
All clinical students must successfully complete four semesters of supervised practicum experience. A pre-practicum experience during which students can gain initial exposure to clinical settings begins in the second year. The full practicum experience typically begins during the third year in residence but can begin during the summer after the second year. Note that any summer practicum experiences must be audited; enrolling over the summer in a practicum experience for credit hours will automatically result in a tuition charge to the student. Many students opt to pursue additional experiences during summers and/or in year 5. It is expected that students will be engaged in practicum for 12 hours per week during the semester. Students are expected to receive two semesters of experience in both the areas of psychological assessment and intervention during the course of their practicum training. Typically, specific practica focus on either assessment or intervention, although several combine training in both components. Ideally, students should receive training in both in-patient and out-patient settings.

A maximum of six credit hours from any one training site may be applied toward meeting practicum requirements. Practicum credit will be awarded only for practica completed at agencies approved by the Co-Directors of Clinical Training. Additional information concerning practicum requirements and procedures is available in the Practicum Handbook *B*: Practica Requirements and Procedures for Clinical Psychology. Descriptions of the specific practicum sites are available in the brochure titled Practicum Handbook *A*: Clinical Psychology Practicum Sites.

Clinical students in the A & S Psychology Department who are receiving practicum training must enroll in (a) Year 3: either PSY 8323-A&S [Formerly PSY 323-A&S] (Assessment) or PSY 8324-A&S [Formerly PSY 324-A&S] (Psychotherapy) (usually PSY 8323-A&S) [Formerly PSY 323-A&S]; and, (b) Year 4: either PSY 8323-A&S [Formerly PSY 323-A&S] (Assessment) or PSY 8324-A&S [Formerly PSY 324-A&S] (Psychotherapy) (usually PSY 8324-A&S) [Formerly PSY 324-A&S]. Two semesters each of PSY 8323-A&S [Formerly PSY 323-A&S] and PSY 8324-A&S [Formerly PSY 324-A&S] are required. In Year 5 and beyond, students register for either PSY 8325-A&S (Advanced Assessment) [Formerly PSY 325-A&S] or PSY 8326-A&S (Advanced Psychotherapy) [Formerly PSY 326-A&S].

Clinical students in the Department of Psychology and Human Development who are receiving practicum training must enroll in either PSY-GS 9950-P [Formerly PSY-GS 390-P] or PSY-GS 9951 [Formerly PSY-GS 391-P].
A.4. Annual Review
At the conclusion of the spring semester the clinical training faculty meet to evaluate the progress of each student in the program. All facets of a student’s training are considered. Individual faculty advisors then complete an Annual Evaluation Form that summarizes the student’s progress. Advisors then meet individually with each advisee to review the form and accompanying feedback.

Students who have advanced to doctoral candidacy (i.e., successfully completed the Qualifying Exam) are required to submit a curriculum vita and brief (i.e., one page) progress report detailing their accomplishments over the past year and plans for the next year.

A.5. Research Requirements (Years 1-3)
It is expected that: (1) students will conduct at least one empirical research project prior to reaching Ph.D. candidacy; (2) this project will culminate in a manuscript that can be submitted for publication; and, (3) the project will preferably be completed no later than the beginning of the third year. The student’s primary advisor will be the principal supervisor of the project.

The committee reviewing the empirical project will consist of the primary advisor and at least one additional faculty member, but two additional faculty members are preferred. Students are encouraged to have at least one formal meeting with their advisory committee during each of the first three years in the program to evaluate progress and provide feedback (a minimum of two meetings is preferred). The student’s advisory committee may require such meetings.

Students will submit their final manuscript to their committee for review. In consultation with their advisor, students will either: (1) meet with the advisor and the other faculty member(s) to discuss the paper; or, (2) receive detailed written feedback about the manuscript from the other faculty member(s). In both cases, members of the committee will complete a Research Evaluation form. The primary advisor will provide feedback to the student concerning the evaluations. Students are encouraged to discuss their manuscript and the evaluations with the other member(s) of their committee.

Students also will have the opportunity to present their work during clinical science seminar meetings, developmental psychopathology pro-seminar, and/or the intervention research pro-seminar. In addition, students are strongly encouraged to present their work at professional conferences and are expected to submit their work for publication.

A.6. Qualifying Examination
As described in the Graduate School Bulletin, the purpose of the qualifying (i.e., preliminary) examination is to evaluate the student’s knowledge of the field of specialization, to assess familiarity with the published literature, and to determine whether the student possesses the skills necessary to be advanced to doctoral candidacy and to succeed in a scholarly career.
In the Clinical Science program, the written product that constitutes the basis for the qualifying exam is a Major Area Paper (MAP) that is an integrative review of an area of study that typically has been the focus of the student’s research for the past several years. It should have the scope and length of review articles that appear in Psychological Bulletin or Clinical Psychology Review.

A Qualifying Committee will evaluate the qualifying exam. The Qualifying Committee consists of at least four members of the Graduate Faculty of Vanderbilt University with at least three members from the Vanderbilt Psychological Sciences faculty and at least one faculty member from outside the home department (i.e., another Vanderbilt Department such as the Department of Psychiatry at the Vanderbilt Medical School). Faculty members from other universities can serve on Qualifying Committees but cannot substitute for an outside the department representative from the Graduate Faculty of Vanderbilt. In forming a Qualifying Committee, students should consult with their advisors and the two should mutually decide upon a set of faculty members who would be appropriate for the committee. The student should then submit this set of recommendations to the Director of Graduate Studies of the home department. Following any discussions that may be necessary with the student, the Director of Graduate Studies will make recommendations to the Dean of the Graduate School for the formal appointment of the Qualifying Committee at least 2 weeks prior to the targeted date of the exam. The Qualifying Committee will also typically serve as the Dissertation Committee, although this is not a formal requirement.

The qualifying examination must be held no later than May 1st of the fourth year, and no later than May 1st prior to the fall semester during which a student intends to apply for internship. For that examination, the student will meet with the Qualifying Committee. One focus of the meeting will be the written product with additional foci introduced at the discretion of the committee. Any written product should be handed to the committee two weeks prior to the date of the exam. At the end of the meeting, the committee, in executive session, will vote on the performance of the candidate. The possible options are: (1) pass, which means that the student is advanced to doctoral candidacy and is allowed to prepare a dissertation proposal; (2) conditional pass, which means that the student must undertake some specific additional work before a pass can be recommended; (3) failure, either with the option of reexamination, or without (with the latter option meaning termination from the program). Failure to pass the qualifying examination after two tries will result in termination from the program.

A.7. Dissertation Proposal and Dissertation
Clinical students must follow the guidelines for dissertation proposal meetings and final orals outlined in Section IX below. The Clinical Science area group supports a presentation of the dissertation prior to the oral examination in a public format that is open to the broader University community. Only Committee members will be present during the dissertation defense and during deliberations by the Committee concerning the student’s qualifications and performance. Clinical students must have a dissertation proposal approved on or before October 15 of the fall semester during which they intend to apply for internship.
A.8. Clinical Internship
All clinical students are expected to complete successfully an APA approved clinical psychology internship. In rare cases, a student may attend a non-APA internship if it is in the student’s best interest. Completion of the internship is reflected in enrollment in PSY 398 during the duration of the internship. There are several requirements for internship eligibility. First, students may not go on internship until: (a) they have met all of the course and practicum requirements of the department and the clinical area; and, (b) the clinical faculty has agreed that the student is academically and personally ready to apply for internship. Second, as noted above: (a) students must have completed their qualifying exam by May 1st of the year during which they intend to apply for internship; and (b) students must have a dissertation proposal approved on or before October 15 of the year during which they intend to apply for internship. Both requirements presume that students apply for internship during the fall semester of a given year.

B. Cognition and Cognitive Neuroscience Area

Graduate students in the Cognition and Cognitive Neuroscience program become active in research during their first semester in the program and are required to engage in collaborative research throughout the degree program. Course work includes introductory survey courses, specialized didactic courses, advanced seminars, and methods courses. Students also receive strong training in professional speaking and writing by way of semester research reports and colloquia.

B.1. Course Requirements
The Cognition and Cognitive Neuroscience area group requires participation in a weekly seminar (PSY 8557-A&S [Formerly PSY 357-A&S] that primarily involves presentations by faculty, students, and guests. Students formally register for this seminar during the second and third years. In the first year, students audit this seminar.

B.2. Research Requirements during the First Two Years
Students are expected to complete a research project in each of the first two years. An Advisory Committee consisting of three faculty members from Psychological Sciences will evaluate students' research progress and provide feedback about research. The advisor will serve as chair of the Advisory Committee. Meetings with the Advisory Committee must occur by May 1st of each of the first two years. At least one week before the meeting, students will provide committee members with written evidence of research productivity. Such evidence may consist of papers describing completed research projects or papers ready for submission to journals or conferences. During the meeting, the Advisory Committee will discuss the presentation and written report with the student. At the end of each meeting, the members of the Advisory Committee will meet without the student present to evaluate the student’s progress. Following each meeting, the advisor will provide feedback to the student concerning the evaluations.

At the end of the first year, all students will give a brief public presentation of their research at the annual first-year research presentations scheduled for early to mid May.
Second-year and third-year students are expected to present their research at one of the CCN Friday seminars (either the fall or spring semester of the second year).

All students in the CCN program are expected to complete a graduate fellowship application in their first year. If they are eligible for funding from an agency, their advisor will determine whether the application should be submitted for review. For U.S. students, this will be an NSF graduate fellowship or an NRSA predoctoral fellowship from the NIH. For Canadian students, this will be an NSERC. For students from other countries, the advisor, area heads, and Director of Graduate Studies will attempt to find other possible sources for fellowship funding.

B.3. Qualifying Examination
As described in the Graduate School Bulletin, the purpose of the qualifying (i.e., preliminary) examination is to evaluate the student’s knowledge of the field of specialization, to assess familiarity with the published literature, and to determine whether the student possesses the skills necessary to be advanced to doctoral candidacy and to succeed in a scholarly career.

A Qualifying Committee will evaluate the qualifying exam. The Qualifying Committee consists of at least four members of the Graduate Faculty of Vanderbilt University with at least three members within the student’s area group (with the members coming from either A & S Psychology or P & HD; with the provision that at least one member is from the same Psychology Dept as the student) and at least one faculty member from outside the home department (i.e., either from the other Psychology Department or another Vanderbilt Department such as the Department of Computer Science). When the outside-department member is from the other Psychology Department (e.g., the Department of Psychology and Human Development in the case of an Arts & Science student), that individual should have a primary affiliation with an area group other than Cognition and Cognitive Neuroscience. Furthermore, students should consult with their advisor or the DGS to ensure that an outside committee member from the other psychology department is from a substantively different area of research (e.g., a Cognition and Cognitive Neuroscience graduate student doing cognitive neuroscience research should probably not select a Neuroscience faculty members from Psychology doing human cognitive neuroscience research). If the student has a minor concentration, one member of the committee should be from the minor area.

Faculty members from other universities can serve on Qualifying Committees. If they are a fifth committee member, they can simply be added to the committee. But if this person is intended to count as the person from outside the home department, then the committee nomination form must be accompanied by the following: (1) A letter from the student’s primary advisor that clearly states why this outside committee member has unique expertise that contributes a unique perspective on the student’s work, (2) a description of how this outside committee member will contribute to the student’s training above and beyond simply calling into the qualifying examination and dissertation meetings, and (3) a curriculum vitae of the outside committee member. The outside committee member must have academic credentials comparable to that of faculty at Vanderbilt. But just as
important, there must be mechanisms in place that allow the graduate student to have meaningful interactions with the outside committee member apart from committee meetings – the most obvious mechanism would be an active collaboration, but other mechanisms are possible as well.

In forming a Qualifying Committee, students should consult with their advisors and the two should mutually decide upon a set of faculty members who would be appropriate for the committee. The student should then submit this set of recommendations to the Director of Graduate Studies of the home department. Following any discussions that may be necessary with the student, the Director of Graduate Studies will make recommendations to the Dean of the Graduate School for the formal appointment of the Qualifying Committee at least 2 weeks prior to the day of the Qualifying Exam. The Qualifying Committee will also typically serve as the Dissertation Committee, although this is not a formal requirement.

Students will be required to submit a reading list and a list of issues to be addressed in the qualifying examination by the end of the fall semester of their third year. This list will be generated by the student and approved by each member of the Qualifying Committee. Committee members can add or delete readings from the list and, more generally, will have input on the list of issues to be addressed.

The written component of the qualifying examination will consist of a Major Area Paper (MAP) that is an integrative review of an area of study that typically has been the focus of the student’s research for the past several years. It should have the scope and length of review articles that appear in Psychological Bulletin. The qualifying examination itself will consist of the written component plus an oral examination on the written component and the readings and issues previously agreed upon. The qualifying examination should be held no later than at the end of the third year. The paper should be distributed to the committee two weeks prior to the meeting.

At the end of the qualifying examination meeting, the committee will vote on the performance of the candidate. The possible options are: (1) pass, which means that the student is advanced to doctoral candidacy and allowed to prepare a dissertation proposal; (2) conditional pass, which means that the student must undertake some specific additional work before a pass can be recommended; (3) failure, either with the option of re-examination, or without (in the latter case, the student will be terminated from the program). Failure to pass the qualifying examination after two tries will result in termination from the program.

After the first two years in the program, students are expected to maintain an active, self-motivated research program. In addition to the qualifying examination described above, research achievement (as evidenced by published papers in peer-reviewed journals, presentations at national conferences, and book chapters) will be central to continued success and good standing in the program.
B.4. Dissertation Proposal and Dissertation

Students must follow the guidelines for dissertation proposal meetings and final orals outlined in Section IX below. The Cognition and Cognitive Neuroscience area group expects a presentation of the dissertation just prior to the oral defense in a public format that is open to the broader University community. The committee may choose to conduct the oral defense portion of the meeting with only committee members present. Deliberations concerning the student's qualifications and performance in the defense will always be limited to committee members.

C. Developmental Science Area

The Developmental Science program offers students a program of studies that includes specific course requirements and extensive participation in research.

C.1. Course Requirements

In addition to meeting all general course requirements applicable to all graduate students, students in the Developmental Science program must earn a grade of B- or above in the following courses. These courses can also be used to fulfill general course requirements.

1. Developmental Psychology PSY-GS 8400-P [Formerly PSY-GS 360-P] or Seminar in Cognitive Development – PSY-GS 8450-P [Formerly PSY-GS 361-P]; meeting a breadth requirement under general course requirements

2. *Four Additional Courses focused on Developmental Sciences.* Example classes include Seminar in Cognitive Development – PSY-GS 8450-P [Formerly PSY-GS 361-P]), Seminar in Social and Personality Development - PSY 8600-A&S [Formerly PSY-GS 363-A&S], Advanced Seminar in Developmental Psychology – PSY-GS 8460-P [Formerly PSY-GS 368-P], Cognitive Science to the Classroom – PSY-GS 8470-P [Formerly PSY-GS 362-P], Educational Neuroscience – PSY-GS 8480-P [Formerly PSY-GS 367-P]. Other courses that have a substantial focus on development can receive approval by the Developmental Area Head. Individual advisors may require particular courses.

3. Cognitive Science of Learning and Development (CSLD) Research Forum – PSY-GS 8690-P [Formerly PSY-GS 365-P]. Students should enroll for 0 credit hours in the Fall and 1 credit hour in the Spring of each year. Students are expected to present their research once a year.

Substitutions or exceptions may be allowed with the written approval of the Developmental Sciences Area Head.

C.2. Research Requirements

It is expected that: (1) students will conduct at least one empirical research project, usually a Master’s project, prior to reaching Ph.D. candidacy; (2) this project will culminate in first-author manuscript that can be submitted for publication; and, (3) this project will preferably be completed no later than the beginning of the third year. Multiple empirical research studies prior to reaching Ph.D. candidacy are encouraged.
The student’s primary advisor will be the principal supervisor of the projects. The Advisory Committee (see below) will review the empirical projects. Students will submit their final manuscript to their committee for review. The primary advisor will provide feedback to the student concerning the evaluations made by committee members. Students are encouraged to discuss their manuscript and the evaluations with the other member(s) of their committee.

Students also are expected to present their research each year during Cognitive Science of Learning and Development (CSLD) Research Forum. At the end of the first year, this research presentation is given during the annual first-year research presentation day scheduled near the end of the Spring semester. In addition, students are expected to present their work at professional conferences.

C.3. Advisory Committee
The Advisory Committee, whose job it is to oversee student progress, will be selected in the fall semester of the first year in collaboration with the major advisor. The Advisory Committee consists of two or three faculty members (including the student’s advisor) chosen in the first year. When other committees are formed in subsequent years (e.g., the Master’s Committee, the Continuing Committee evaluating the Qualifying Exam), that committee becomes the student’s Advisory Committee. Membership on the Advisory Committee requires approval of the Developmental Sciences Area Head.

C.4. Master’s Committee
The Advisory Committee may become the Master’s Committee, but the committee may also be reconstituted to reflect the content of the Master’s project. The committee consists of two or three faculty members (including the student’s advisor), with at least two members being core members of the Developmental faculty. Committees must be approved by the Developmental Area Head.

C.5 Qualifying Exam Committee
The qualifying exam committee consists of at least four members of the Graduate Faculty with at least three members within the student’s home department (typically P & HD) and at least one faculty member from outside the home department (i.e., either from the other Psychology Department or another Vanderbilt Department such as the Department of Psychiatry at the Vanderbilt Medical School).

Faculty members from other universities can serve on Qualifying Committees. If they are a fifth committee member, they can simply be added to the committee. But if this person is intended to count as the committee member from outside the home department, then the committee nomination form must be accompanied by the following: (1) A letter from the student’s primary advisor that clearly states why this outside committee member has unique expertise that contributes a unique perspective on the student’s work, (2) a description of how this outside committee member will contribute to the student’s training above and beyond simply calling into the qualifying examination and dissertation meetings, and (3) a curriculum vitae of the outside committee member. The outside committee member must have academic credentials comparable to that of faculty at Vanderbilt. There must be mechanisms in place that allow the graduate student to have
meaningful interactions with the outside committee member apart from committee meetings – the most obvious mechanism would be an active collaboration, but other mechanisms are possible as well.

In forming a Qualifying Committee, the students should consult with their advisors and the two should mutually decide upon a set of faculty members who would be appropriate for the committee. The student should then submit this set of recommendations to both the Developmental Sciences Area Head and the Director of Graduate Studies of the home department. Following any discussions that may be necessary with the student, the Director of Graduate Studies will make recommendations to the Dean of the Graduate School for the formal appointment of the Qualifying Committee at least 2 weeks prior to the day of the exam. The Qualifying Committee will also typically serve as the Dissertation Committee, although this is not a formal requirement.

C.5. Annual Review
The student will complete a milestone report and current CV to be submitted in the spring of each year. The Advisory Committee will meet with the student to review progress during the previous year. The entire developmental faculty will then meet to review the Advisory Committee reports at the end of each academic year. It is the student’s responsibility to prepare the report and convene the advisory committee before the faculty meets. The milestone report will include evidence of student progress in coursework, research, and other training. Evidence of research progress may include submissions to national or regional meetings, papers submitted, proposals written and defended, and data collected.

C.6. Qualifying Examination
As described in the Graduate School Bulletin, the purpose of the qualifying examination is to evaluate the student’s knowledge of the field of specialization, to assess familiarity with the published literature, and to determine whether the student possesses the skills necessary to be advanced to doctoral candidacy and to succeed in a scholarly career. See the section on Qualifying Exam Committee for Graduate School rules on committee membership.

The qualifying exam consists of a written component plus an oral examination. For the written component, students may choose, in consultation with their advisor, to write a Major Area Paper or to take a preliminary exam. The required 24 hours of course work must be completed first. Either exam option should be undertaken during the third year and completed before the start of the fourth year. Per graduate school requirements, it must be completed by the end of the fourth year under normal circumstances.

The Qualifying Committee and the student will develop a reading list. The student should submit the reading list for committee input and approval near the beginning of the third year.
Written Exam

Option 1: Preliminary exam. The written preliminary exam covers basic developmental issues and questions, research methods and statistics, and current literature in the field and in the student’s specialty area. Students’ develop a reading list that typically covers 3 general topics based on readings from course work and 3 specialty topics based on the students’ research interests, with about 20 articles per topic. At a designated time, students are given a set of potential essay questions and are asked to select 5 questions to answer over the course of 5 days. The exam is typically taken at the beginning of the spring semester of the third year and is distributed to all members of the Developmental Science faculty, as well as outside committee members.

Option 2: Major Area Paper. The Major Area Paper (MAP) is an integrative review of an area of research central to the students’ own research. It should provide a synthesis, not just a summary, of research, and usually builds an argument for a particular perspective. The scope of the review should be defined so that 50-60 journal articles capture the key research in the area, but the review does not need to be exhaustive. A reading list is developed and approved by the committee in advance of writing the paper, with 60-75 proposed readings (assumes that some readings will ultimately not be included in the review paper). The reading list should be divided into sub-categories, with articles grouped into proposed sections for the paper. The paper should be 30-50 pages (excluding references) and written to be understandable to developmental science researchers outside the topic area. The paper should be distributed to the committee members as well as other members of the Developmental Science faculty. It is typically completed by the end of the spring semester of the third year.

Oral Exam: The oral component of the qualifying exam is administered by the Qualifying Exam committee and is not a public meeting. At least two weeks in advance of the oral meeting, the written component must be completed and the Graduate School must be notified. The exam begins with about a 20-minute presentation by the graduate student on their research area, focused on the MAP if applicable. Committee members will ask questions concerning the written exam, the reading list and the students’ research interests.

After reviewing the oral qualifying exam, the committee will vote on the performance of the candidate. The possible options are: (1) pass, which means that the student advances to doctoral candidacy and is allowed to prepare a dissertation proposal; (2) conditional pass, which means that the student must undertake some specific additional work before a pass can be recommended; and, (3) failure, either with the option of re-examination, or without (in the latter case, the student will be terminated from the program). Per Graduate School requirements, failure to pass the qualifying examination after two tries will result in termination from the program.

C.7. Doctoral Dissertation

Developmental students must follow the guidelines for dissertation proposal meetings and final orals outlined in Section IX below.
D. Neuroscience Area

The goal of the Neuroscience Program is to form the next generation of leading neuroscientists. To achieve this goal, our program emphasizes intensive research experience with one or more faculty members from the first year of graduate school. This laboratory experience is complemented in the first two years of graduate school by course work to provide at once a broad and deep conceptual background of the field.

D.1. Course Requirements

In addition to meeting all general course requirements applicable to all graduate students, students in the Neuroscience program must pass (with a grade of B- or greater) the following courses:

1. Fundamental Neuroscience (NURO 8340 in Fall) [Formerly NURO 340]
2. At least one of the following courses or other courses with approval of advisory committee and Director of Graduate Studies:
   b. Brain Imaging Methods PSY 8216-A&S [Formerly PSY 316-A&S]
   c. Computational Modeling PSY 8218-A&S [Formerly PSY 318-A&S]
   d. Scientific Computing for Psychological and Brain Science PSY 8219-A&S [Formerly PSY 319-A&S]
   e. Seminar: Neuroscience PSY 8744-A&S [Formerly PSY 344-A&S]
   f. Electrophysiological Techniques PSY 8744-A&S [Formerly PSY 344-A&S]
      i. Other topics as they are offered
   g. Scientific Writing in Psychology and Neuroscience PSY 8750-A&S [Formerly PSY 350-A&S]
   h. Neuroanatomy NSC 3274 [Formerly NSC 274]
   i. Cognitive Neuroscience NURO 8330 [Formerly NURO 330]
   j. Fundamental Neuroscience NURO 8345 [Formerly NURO 345] in Spring

3. The Neuroscience program requires participation in a weekly seminar (PSY 8758-A&S) [Formerly PSY 358-A&S] that primarily involves presentations by faculty, students, and guests. Students formally register for this seminar during the second and third years. In the first year, students audit this seminar. We expect our graduate students to present seminars at least once a year.
D.2. Research Requirements
Students are expected to complete a research project in each of the first two years. An Advisory Committee, consisting of three faculty members (including the advisor) from Psychological Sciences, will evaluate students’ research progress and provide feedback about research. The advisor will serve as chair of the Advisory Committee. Meetings with the Advisory Committee must occur by May 1st of each of the first two years. At least one week before the meeting, students will provide committee members with written evidence of research productivity. Such evidence may consist of papers describing completed research projects (e.g., APA style papers ready for submission to journals) and/or papers submitted to conferences. During the Advisory Committee meeting, students will be expected to give an oral presentation describing the research that they have conducted during the past year. Following this presentation, the Advisory Committee will discuss the presentation and written report with the student. At the end of each meeting, the members of the Advisory Committee will meet without the student present and individually complete Research Evaluation forms. The committee will then discuss their ratings and comments including any discrepancies in their evaluations. Following each meeting, the advisor will provide feedback to the student concerning the committee’s evaluations.

At the end of the first year, students are encouraged, and may be required by their advisor, to give a brief public presentation of their research at the annual first-year research presentations scheduled for early May. Second and third-year year students are expected to present their research at one of the Thursday Neuroscience seminars (either the fall or spring semester of the second year).

D.3. Qualifying Examination
As described in the Graduate School Bulletin, the purpose of the qualifying examination is to evaluate the student’s knowledge of the field of specialization, to assess familiarity with the published literature, and to determine whether the student possesses the skills necessary to be advanced to doctoral candidacy and to succeed in a scholarly career.

A Qualifying Committee will evaluate the qualifying exam. The Qualifying Committee consists of at least four members of the Graduate Faculty with at least three members within the student’s home department (A&S Psychology) and at least one faculty member from outside the home department (e.g., either from the other Psychology Department or another Vanderbilt Department such as the Department of Pharmacology at the Vanderbilt Medical School). In forming a Qualifying Committee, students should consult with their advisors and the two should mutually decide upon a set of faculty members who would be appropriate for the committee. Students should consult with their advisor or the DGS to ensure that an outside committee member from Psychology and Human Development is from a substantively different area of research (e.g., a Neuroscience graduate student doing cognitive neuroscience research should probably not select a Cognition and Cognitive Neuroscience faculty member from Psychology and Human Development as their outside committee). Students should then submit this set of recommendations to the Director of Graduate Studies of the home department. Following any discussions that may be necessary with the student, the Director of Graduate Studies
will make recommendations to the Dean of the Graduate School for the formal appointment of the Qualifying Committee at least 2 weeks prior to the day of the exam. The Qualifying Committee will also typically serve as the Dissertation Committee, although this is not a formal requirement.

Faculty members from other universities can serve on Qualifying Committees. If they are a fifth committee member, they can simply be added to the committee. But if this person is intended to count as the person from outside the home department, then the committee nomination form must be accompanied by the following: (1) A letter from the student’s primary advisor that clearly states why this outside committee member has unique expertise that contributes a unique perspective on the student’s work, (2) a description of how this outside committee member will contribute to the student’s training above and beyond simply calling into the qualifying examination and dissertation meetings, and (3) a curriculum vitae of the outside committee member. It probably goes without saying that the outside committee member must have academic credentials comparable to that of faculty at Vanderbilt. But just as important, there must be mechanisms in place that allow the graduate student to have meaningful interactions with the outside committee member apart from committee meetings – the most obvious mechanism would be an active collaboration, but other mechanisms are possible as well.

The qualifying examination will consist of the written component plus an oral examination that focuses on the written component but can encompass even broader issues of relevance. The written component of the qualifying examination will consist of a Major Area Paper (MAP) that is an integrative review of an area of study that typically has been the focus of the student’s research for the past several years. It should have the scope and length of review articles that appear in the Annual Review of Neuroscience. The purpose of the qualifying exam is to evaluate breadth and depth of knowledge in the research domain; it is not as focused on issues of experimental design.

The qualifying examination must be held no later than May 1st of the third year. The paper should be distributed to the committee two weeks prior to the meeting. For that examination, the student will meet with the Qualifying Committee. Students who fail to meet this requirement by the May 1st deadline may be terminated from the program. One focus of the meeting will be the written product with additional foci introduced at the discretion of the committee.

At the end of the meeting, the committee, in executive session, will vote on the performance of the candidate. The possible options are: (1) pass, which means that the student advances to doctoral candidacy and is allowed to prepare a dissertation proposal; (2) conditional pass, which means that the student must undertake some specific additional work before a pass can be recommended; (3) failure, either with the option of reexamination, or without (with the latter option meaning termination from the program). Failure to pass the qualifying examination after two tries will result in termination from the program.

Students must follow the guidelines for dissertation proposal meetings and final orals outlined in Section IX below. As stated in the general guidelines, there is no single model or set of expectations for the final dissertation or the dissertation proposal. The expectations are determined by the advisor and the committee, in consultation with the student. A dissertation may reflect a single substantive research project outlined in the proposal or it may reflect the culmination of a few years of research on single topic.

For the latter case, one model some advisors and committees have recommended for their graduate students is that the final dissertation should include work equivalent to three published papers (of average length as defined by the subarea of research). Under that model, a good rule of thumb is that the dissertation proposal should also reflect proposed research broadly equivalent to one or more of those to-be-published papers. The dissertation proposal should then include as appendices any completed manuscripts and publications that will be part of the final dissertation.

The Neuroscience area group expects a presentation of the dissertation just prior to the oral examination in a public format that is open to the broader University community. However, only Committee members will be present during the dissertation defense and during deliberations by the Committee concerning the student’s qualifications and performance.

E. Quantitative Methods Area

The primary aim of the QM program is to offer students and advisors a program of study that provides a balance between specific course requirements and participation in research, recognizing the diverse demands presented by the different programs offered within Psychological Sciences. The program emphasizes the development of both quantitative and methodological expertise, research and teaching ability, and strong communication skills.

E.1. Major Advisor and Advisory Committee

A major advisor, who is selected at the time of admission, supervises each student. An Advisory Committee, consisting of the advisor and two additional members of the QM area, is formed during the first year. In cases where the student’s research interests require substantive expertise from outside the QM area, a fourth member from outside the QM area may be added. The Advisory Committee may be updated in relation to changing interests, and in particular an additional member is usually added for breadth for qualifying exams and the dissertation.

E.2. Course Requirements

1. The core sequence: The required first-year graduate statistics sequence as described in Section VI.A above.

2. QM course requirements. Ten additional courses are required beyond the core sequence, chosen by the advisor and student from a list of offerings.
that includes standard courses, topical seminars, and appropriate courses in our own and in other graduate programs. The current list of topics includes but is not limited to: Factor Analysis, Categorical Data Analysis, Nonparametric Statistics, Analysis of Quasi-Experimental Designs, Meta-Analysis, Multilevel Modeling, Structural Equation Modeling, Item Response Theory, Linear and Non-Linear Modeling, Growth Curve Modeling, Mixture Modeling, Exploratory Data Analysis, Correlation and Regression, Psychological Measurement, Multivariate Analysis, Methods of Psychological Research, Clinical Research Methods, and other topical Quantitative Seminars. Additional methods courses (e.g. biostatistics) can be counted towards the ten courses with approval from the program director and the major advisor. Beyond the 10 required quantitative courses, it is also required for the student to register for and attend the 1-credit Quantitative Forum every semester. Finally, additional Breadth course requirements of the College and Graduate School are detailed elsewhere in this document.

3. Proficiency in one year of calculus. All students are required to demonstrate proficiency in two semesters of undergraduate-level first-year university calculus. Such proficiency is gained either through having taken the courses prior to entering the QM Program (e.g., during undergraduate training) or by attendance in classes offered at Vanderbilt (or some other university).

E.3. Annual Review
Each QM student will complete the Peabody on-line progress report and submit a current curriculum vita to the Program Director in the spring of each year. The student and advisor should schedule an official meeting with the Advisory Committee to discuss the student’s progress. An annual Student Progress Evaluation Meeting of all area faculty members is held for open discussion of student progress. After this meeting, evaluation letters are drafted by the major advisor and finalized by the program director, then mailed to the students under the signature of the QM Director. Copies of these letters are placed on file each spring with the Director of Graduate Studies of the home department.

E.4. First-year Research Presentation
Developing oral presentation and teaching skills is a crucial part of the development of the QM student. At the end of the first year, the student will deliver an oral presentation of research, typically to the QM brownbag. This can be a presentation on current research, a tutorial on some interesting area in Quantitative Methods, a proposal for master’s thesis research, or a practice presentation for an academic conference.

E.5. Masters Thesis
In the second year, the student should develop a master’s thesis topic and defend it before the advisory committee, and during the third year, the student should complete the master’s thesis.
E.6. Qualifying Examination
After successful defense of the masters thesis the student should form a Qualifying Committee. As described in the Graduate School Bulletin, the purpose of the qualifying examination is to evaluate the student’s knowledge of the field of specialization, to assess familiarity with the published literature, and to determine whether the student possesses the skills necessary to advance to doctoral candidacy and to succeed in a scholarly career. Typically, the qualifying examination is taken before the beginning of the fourth year.

The Qualifying Committee should consist of three faculty members of the QM area (normally the student’s Advisory Committee) and one from outside the home department (i.e., either from the other Psychology Department or another Vanderbilt Department such as Biostatistics or Sociology). If the student has a minor concentration, one member of the committee should be from the minor area. In forming a Qualifying Committee, the student should consult with her or his advisor and they should mutually decide upon a set of faculty members who would be appropriate for the committee. The student should then submit this set of recommendations to the Director of Graduate Studies of the home department. Following any discussions that may be necessary with the student, the Director of Graduate Studies will make recommendations to the Dean of the Graduate School for the formal appointment of the Qualifying Committee at least 2 weeks prior to the day of the exam. The Qualifying Committee will also typically serve as the Dissertation Committee, although this is not a formal requirement.

The qualifying examination consists of breadth and depth components. The breadth component will typically be a one-day examination requiring integrative thinking across previous coursework. The depth component can take one of two forms, chosen by the major professor/advisory committee: a 1-2 day directed examination in which the student answers specific questions or a 4-6 day take home examination in which the student develops a research proposal that could serve as the introduction to a dissertation prospectus. Both of these options reflect a reading list developed by the student and the major advisor/advisory committee. The written qualifying examination will be evaluated by the advisory committee, and the committee will meet with the student for an oral examination that focuses on the written component but encompasses even broader issues of relevance. At the end of the oral exam meeting, the committee in executive session will vote on the performance of the candidate. The possible options are: (1) pass, which means that the student advances to doctoral candidacy and is allowed to prepare a dissertation proposal; (2) conditional pass, which means that the student must undertake some specific additional work before a pass can be recommended; and, (3) failure, either with the option of reexamination, or without (in the latter case, the student will be terminated from the program). Failure to pass the qualifying examination after two tries will result in termination from the program.

E.7. Dissertation Proposal and Dissertation
Students must follow the guidelines for dissertation proposal meetings and final orals outlined in Section IX. The QM area expects a presentation of the dissertation before the oral examination in a public format that is open to the broader University community. The actual dissertation defense occurs next, and may be public or not at the committee’s
discretion. However, only Committee members will be present during deliberations by the Committee concerning the student’s qualifications and performance.

**VIII. Master’s Degree**

Our program is not designed for students with a primary interest in a terminal Master’s degree. Students can, however, receive a Master’s degree during their tenure at Vanderbilt. Students affiliated with the Department of Psychology can typically receive a Master’s of Arts degree (though they may instead receive an MSc upon request), while those affiliated with the Department of Psychology and Human Development can receive a Master’s of Science degree. Those who wish to receive a Master’s degree must fulfill the requirements as listed in the Graduate School Bulletin. To be eligible to receive a Master’s degree, the student must have completed a minimum of 30 hours of formal coursework. The student must also complete a master’s thesis project. The written thesis must be approved by two faculty members in the program.

**IX. Doctoral Dissertation**

All of our doctoral programs require that a doctoral dissertation proposal be submitted after the Qualifying Examination has been successfully completed. The student and his or her advisor will determine the composition of the Ph.D. Committee. In most cases, the Qualifying Committee will constitute the Ph.D. Committee. As is the case with the Qualifying Committee, the Ph.D. Committee should consist of at least four members of the Graduate Faculty with at least three members within the student’s home department (A & S Psychology or P & HD) and at least one faculty member from outside the home department (i.e., either from the other Psychology Department or another Vanderbilt Department such as the Department of Psychiatry at the Vanderbilt Medical School). In the case of Clinical Science and Cognition and Cognitive Neuroscience students, outside-the-department committee members from the other Psychology Department must also be outside the students’ area group (e.g., a Peabody and Human Development Cognition and Cognitive Neuroscience faculty member cannot serve as the outside member for a Cognition and Cognitive Neuroscience student from the Arts and Science Psychology department). Furthermore, to keep within the spirit of this rule, students in other area groups should consult with their advisor or the DGS to ensure that an outside committee member from the other psychology department is from a substantively different area of research (e.g., a Neuroscience graduate student doing cognitive neuroscience research should probably not select a Cognition and Cognitive Neuroscience faculty member from Peabody as their outside committee member). Some area groups permit the outside committee member to be from outside of Vanderbilt; see the area group sections for a discussion of the rules for appointing a committee member from outside of Vanderbilt (under the section for the Qualifying Examination). The advisor will serve as Chair of this committee. The composition of the Ph.D. Committee must be approved by the Director of Graduate Studies of the student’s home department and the Graduate School.
Working with the advisor, the student will prepare a dissertation proposal. The format of the dissertation proposal, as well as the format of the final dissertation, can vary quite a bit across area groups. Some may be proposals for a completely new line research, others may be proposals to continue a successful line of research in new directions, and others may include a fair amount of completed research as well as proposals for new experiments or new analyses. The student will need to work with their advisor and the committee members to determine what constitutes a sufficient proposal for new research for their dissertation. The dissertation committee has wide latitude in determining what is sufficient based on the norms for the area group and the field, and based on the body of independent research completed by the student throughout their graduate career at Vanderbilt.

There are no formal requirements for what should or should not go into the dissertation proposal, but the following guidelines may be useful:

- Proposals should include some general background about the scientific problem. This should not be a complete literature review, as might be done for MAP, nor should the MAP be pasted into the proposal. Instead, there should be a brief yet relatively complete discussion, such as you might see in the introduction to a large empirical or theoretical paper or see in the background section of a grant proposal.

- As appropriate, the proposal should include an integrative discussion of the student’s past research on this scientific problem. This may be pilot research on the proposed experiments. It could also be completed manuscripts and publications that the student will include as part of their complete dissertation.

- If the final dissertation will include papers complete before the dissertation proposal meeting, those papers should be included as appendices to the proposal. The proposal itself should include a detailed discussion of those papers wherever appropriate in the text of the proposal. The completed papers themselves should not be simply pasted into the main body of the proposal itself.

- Students should respect the appropriate tense in their writing. Completed research should be written as completed research, not as proposed research. A large project may have data collection that has been completed and analyses that are proposed, and the proposal should be written to reflect that reality.

It is important to emphasize that the composition of the dissertation proposal is quite heterogeneous across area groups, advisors, and research areas. For some, the dissertation may constitute a single substantive research project completed during the dissertation year. For others, the dissertation proposal may reflect one key aspect of a large-scale project the graduate student has been involved in over the span of several years. And for others, the dissertation proposal may include published or submitted papers completed before the proposal as well as a proposal for new research. The required composition of the dissertation proposal is determined by the advisor and committee, in consultation with the student. What another graduate student did or did not do for his or her proposal is not relevant to these discussions.

Another important thing to emphasize is that the proposal must include some new proposed research. The purpose of the proposal meeting is not to rubber stamp completed research.
The relative amount of new research in the proposal is determined by the advisor and committee, in consultation with the student.

Further information about particular models for dissertation proposals may also be provided under the descriptions of each area group.

The proposal should be distributed to committee members at least 2 weeks prior to a meeting of the thesis committee. During the meeting, it is the student's responsibility to demonstrate to the committee that the proposal is scientifically sound, that the proposed research procedures are feasible (such demonstrations frequently involve extensive pilot research and/or completed research in the area), and that the requisite skills and other resources are available to complete the proposed project in a reasonable time period. After the meeting, the committee can make several alternative decisions, ranging from complete acceptance and approval of the proposal to the requirement that the student prepare a completely different project proposal.

After the proposal is approved the student is free to complete the dissertation under the supervision of the advisor. We strongly discourage students from attempting to complete the dissertation in absentia. Students who decide to complete their dissertation in absentia must submit a timeline for completing their dissertation that must be approved by the advisor and the Director of Graduate Studies of the student’s home department.

There may be times when significant changes to the proposed research are required after the proposal meeting (e.g., initial studies do not turn out as predicted, clinical populations cannot be recruited, etc.); the student should discuss with their advisor what constitutes “significant change” from the original proposal. If those changes are indeed significant, the student must contact the dissertation committee members to notify them of the need for a change and to invite the committee to have another meeting when necessary.

When the advisor serving as the Ph.D. Committee Chair believes that the candidate has prepared an acceptable draft of the dissertation, the student will schedule the final oral examination and inform the Department’s Education Coordinator and Director of Graduate studies of the home department at least 2 weeks prior to the exam. The Director of Graduate Studies will then notify the Graduate School 2 weeks prior to the exam. The student will distribute the final draft to the committee members at least 2 weeks before the scheduled Final Oral Examination.

Both the Neuroscience and QME area groups expect a presentation before the oral examination in a public format that is open to the broader University community. However, only Committee members will be present during the dissertation defense and during deliberations by the Committee concerning the student’s qualifications and performance.

Typically, the dissertation defense will begin with a presentation and summary by the student of the conceptual and methodological basis for the study or studies that were conducted and the results and conclusions. After this presentation, committee members will ask questions and stimulate discussion about various issues related to the dissertation.
At the end of the oral examination, the committee, in executive session, will vote on the performance of the candidate. The possible options are: (1) pass; (2) conditional pass, which means that the student must undertake some specific additional work before a pass can be recommended; (3) failure, either with the option of re-examination, or without (in the latter case, the student will be terminated from the program).

The dissertation must be approved by the Ph.D. Committee before it is submitted to the Graduate School. Approval of the written dissertation may not occur on the day of the oral defense because of corrections suggested by the doctoral committee that need to be made prior to final approval. However, this should not delay forwarding to the Graduate School the decision on the outcome of the oral defense, which is documented with the “Results of Dissertation Defense” form, after the defense has concluded. The Graduate School has a set of guidelines available to students regarding the correct format for dissertations submitted to the Graduate School.

According to Vanderbilt University regulations, the Ph.D. dissertation must be completed and the dissertation defense passed within four years after the student has passed the Qualifying Exam and has been admitted to candidacy for the degree. Upon petition to the graduate school by the Director of Graduate Studies of the student’s home department, a one-year extension of candidacy may be granted. If the time period allotted has expired without successful completion of the dissertation defense, the student is formally removed from the rolls of the Graduate School and will have to re-apply for admission which is subject to the approval of the program faculty. Students re-admitted in this manner may be required to retake the Qualifying Examination.

X. Minors

No minor concentration is required of students in Psychology, and the Neuroscience area requires that its students not seek a minor concentration. Students in other programs may elect to have a minor in an area of Psychology other than their primary area of specialization. Specific area groups determine whether a minor option is offered and the specific requirements for a minor. At the present time, the Cognition and Cognitive Neuroscience, Developmental Science, and Quantitative Methods and Evaluation areas offer minors. The Clinical Science and Neuroscience areas do not offer minors. The specific requirements are as follows:

A. Cognition and Cognitive Neuroscience
Four courses in the Cognition and Cognitive Neuroscience areas (12 credit hours) approved by the head of the Cognition and Cognitive Neuroscience area of the student’s home department.

B. Developmental Science
Developmental Psychology – PSY-GS 8400-P [Formerly PSY-GS 360-P] or Seminar in Cognitive Development – PSY-GS 8450-P [Formerly PSY-GS 361-P] and three additional courses focused on Developmental Sciences (4 courses total). Courses outside
of the area that have a substantial focus on development can receive approval by the Developmental Area Head.

C. Quantitative Methods and Evaluation
The quantitative core sequence consisting of:
   1. The required first-year graduate statistics sequence
   2. The following four additional courses
      a. Psychological Measurement PSY-GS 8876-P [Formerly PSY-GS 317-P]
      b. Correlation and Regression PSY-GS 8870-P [Formerly PSY-GS 313-P]
      c. Multivariate Analysis PSY-GS 8867-P [Formerly PSY-GS 312-P]
      d. One research methods class from the following list:
         1. Methods of Psychological Research PSY-GS 8810 [Formerly PSY-GS 301-P]
         2. Clinical Research Methods PSY 8310-A&S [Formerly PSY 310-A&S]

XI. Teaching
Since the teaching of psychology is something most, if not all, of our students will do at some point in their careers, it is important that they receive some instruction and experience in teaching. For this reason, all students in the program are encouraged to be a teaching assistant in Psychology for at least two semesters during their residence. In order to maintain good standing in the program, a graduate student funded by a teaching assistantship must show satisfactory performance in their TA duties, as assessed by faculty and student evaluations.

XII. Student Evaluations
The relevant departmental faculty reviews all students in yearly evaluation meetings that occur at the end of each spring semester; in some cases, faculty reviews also occur in the fall semester. The major components of these evaluations are: (1) grades in courses; (2) research performance; (3) performance of other milestones (e.g., written qualifying exams); and, (4) performance as a teaching or research assistant (if relevant). We also carefully consider other factors that have a bearing on scholarly potential and career development.

Grades in courses that are less than a C (C- or below) are considered failing. Grades of B- or below are considered cause for concern. All students must have a minimum grade point average of greater than 3.0 (A = 4, B = 3, C = 2) to remain in good standing. Courses included in the computation of GPA include all core courses and seminars. Courses not included in the computation include program seminar series, research credits, practicum credits, and lab/research meetings. Please note that this grade standard is higher than the minimum standard set by the Graduate School.
A satisfactory evaluation of research progress requires evidence of continual involvement in research-related activities, a level of competence appropriate to the student’s experience and area of specialization, and satisfactory completion of research milestones in the required time frame. There should also be evidence for increased research productivity and increased intellectual independence as the graduate student moves through their graduate training.

A satisfactory evaluation of performance as a teaching or research assistant is determined through written evaluation by the faculty supervisor and by student course evaluations (in the case of TA appointments).

The faculty's annual evaluation of a student will result in one of four possible decisions:

1. **Good standing**: The student is considered to be in good standing in the Department and is encouraged to continue.

2. **Probation**: If placed on probation, a student will be given a limited period of time (usually a semester) within which he or she must demonstrate competence in the areas of substandard performance in order to be permitted to continue in the program. The specific accomplishments required of a student in order to be removed from probation will be stated to the student at the time a probation decision is made. If a student fails to remove him- or herself from probation during the allotted time, he or she may be permitted to take a terminal Master’s degree, or may be asked to leave the program immediately, depending upon faculty evaluation of his or her work.

3. **Terminal Master’s Degree**: If the student has not yet received a M.A. or M.S. in Psychology, the student will be permitted to submit work towards a terminal Master’s degree, but will not be allowed to continue to the Ph.D. If this option is selected, it will normally be associated with a strict deadline to submit work specified by the program area in order to receive a terminal masters degree. Failure to meet this deadline will likely result in termination from the program.

4. **Termination from the Program**: The student will be dropped from the program immediately. A majority vote of the relevant faculty in the home department is required to terminate a student from the graduate program. This recommendation will be transmitted to the relevant Graduate Dean. This decision may be appealed in writing.

It should be emphasized that almost all of our students remain in good standing throughout their graduate careers.

Within two weeks after the annual progress evaluation meeting, each student will receive a letter from the Director of Graduate Studies or program area head summarizing his or her program status. Some areas may require a separate evaluation process for their students that incorporates additional criteria (e.g., performance in practica in the case of clinical students).

**XIII. Petitions and Exceptions to Requirements**

In general, exceptions to the requirements may be granted upon petition to the relevant Director of Graduate Studies (DGS) and Area Group Director (AGD). The student will be
required to write a petition explaining the reasons why an exception should be granted and, when appropriate, outline a proposed future course of action.

It is required that the student ask her/his advisor to submit an opinion about the petition. If the advisor does not submit such a statement, it will be assumed by the DGS and AGD that the advisor does not approve the petition. Students have the right to appeal the decision of the DGS and AGD by submitting a petition to the full voting faculty of the home department for consideration. If desired, any member of the student’s current committee (e.g., Advisory Committee, Qualifying Committee), as well as the student, has the opportunity to appear before the faculty.

XIV. Ethics

All faculty and graduate students are expected to adhere to the ethical standards summarized in *Ethical Standards of Psychologists* (American Psychological Association). In addition, students are expected to adhere scrupulously to guidelines for treatment of research participants. These guidelines are detailed in *Ethical Principles in the Conduct of Research with Human Participants* (American Psychological Association). All students whose research involves animals are expected to be familiar with the contents of the *Vanderbilt University Information Manual and Guide for Research Animal Use*, and to comply with the policies, standards, and principles contained therein. Violations of ethical standards constitute potential grounds for dismissal from the program.

We expect that interactions among students, faculty, and staff will be collegial and ethical and will reflect the *APA Ethical Principles of Psychologists and Code of Conduct*. In the context of student-faculty relationships, the following sections of the ethical principles are particularly emphasized:

6.03 (b): When engaged in teaching or training, psychologists recognize the power they hold over students or supervisees and therefore make reasonable efforts to avoid engaging in conduct that is personally demeaning to students or supervisees.

6.05 (a): In academic and supervisory relationships, psychologists establish an appropriate process for providing feedback to students and supervisees.

6.05 (b): Psychologists evaluate students and supervisees on the basis of their actual performance on relevant and established program requirements.

If a student believes that violations of ethical principles have arisen in interactions with faculty, other students, or staff members, several avenues of recourse are available. We recommend that initial discussions be held with one of the following: the Director of Graduate Studies, the relevant Area Group Director, or any other faculty member with whom the student feels comfortable. If issues of sexual harassment or discrimination are
raised, the student will be encouraged to speak to a representative from the *Equal Opportunity, Affirmative Action, and Disability Services Department*, the on-campus facility that offers advice to complainants, investigates sexual harassment and discrimination claims, and can serve to mediate disputes.

**XV. Complaints and Grievances**

The Department of Psychology (Arts and Science) and the Department of Psychology and Human Development (GPC) adhere to Vanderbilt University policy concerning the filing of complaints and grievances. This policy is described in detail in the *Student Handbook* (Chapter 5: University Policies and Regulations), which can be accessed on the web at the following URL: [http://www.vanderbilt.edu/student_handbook](http://www.vanderbilt.edu/student_handbook).
Appendix A: List of Courses that Fulfill Breadth Requirements

This appendix lists the courses within each of the eight areas of study that can be used to fulfill the breadth requirement of satisfactory completion of one course from three areas of specialization (9 credits total). This list pertains specifically to the program requirements discussed on page 6 and not requirements that are specific to any one area group (e.g., Clinical Science). For additional details concerning these and other graduate classes, see the current edition of The Bulletin of Vanderbilt University Graduate School.

I. Clinical Psychology

A. Psychology (Arts & Science)

PSY 8310-A&S [Formerly PSY 310-A&S]. Research Methods in Clinical Psychology. Major methodological and quantitative issues in clinical psychology, including statistical significance testing and its alternatives; threats to internal and external validity; psychometric theory; quantitative approaches to classification; behavioral, genetic, and psychophysiological methods; animal models; analysis of change, mediation, and moderation.

PSY 8352 [Formerly PSY 352]. Seminar: Clinical Psychology.

B. Psychology and Human Development (GPC)

PSY-GS 8100-P [Formerly PSY-GS 336-P]. Behavioral Pediatrics and Child Health Psychology. Behavioral pediatrics and child health psychology for advanced predoctoral and postdoctoral trainees. Topics include the scope and definition of behavioral pediatrics, measurement of child behavior, children’s health beliefs and understanding of illness, theories of psychosomatic illness, immunologic and endocrinologic aspects of stress, compliance, psychological effects of physical illness, families’ responses to stress, and psychological intervention strategies.

PSY-GS 8420-P [Formerly PSY-GS 349-P]. Advanced Seminar in Clinical Psychology.
II. Cognition and Cognitive Neuroscience

A. Psychology (Arts & Science)

PSY 6310-A&S [Formerly 301a-A&S]. Advanced General Psychology (Cognitive)

PSY 8503-A&S [Formerly PSY 303-A&S]. Models of Human Memory. Survey of contemporary models of human memory, especially formal models. Methods of fitting models to data will be discussed. Prerequisite: graduate course on cognition.

PSY 5780-A&S [Formerly PSY 336-A&S]. The Visual System. (Also listed as Cell and Developmental Biology 347, Electrical Engineering 351, Neuroscience 347) An interdisciplinary approach to how humans see and interpret their visual environment. Topics include the structure of the eye and brain (including optics), the physiology of individual cells and groups of cells, machine vision and models of visual function, visual attention, and mechanisms of complex visual perception. Lectures by faculty from Psychology, Engineering, and Cell and Developmental Biology. Graduate students attend one hour discussion section per week, in addition to lecture, and turn in a more extensive paper than undergraduates.

PSY 8744-A&S [Formerly PSY 344-A&S]: Seminar: Neuroscience - Neurobiology of Attention
PSY 8744-A&S [Formerly PSY 344-A&S]: Seminar: Neuroscience - Sem:Neuro of Consciousness
PSY 8744-A&S [Formerly PSY 344-A&S]: Neuroscience - Neurolaw

B. Psychology and Human Development (GPC)

PSY-GS 8450-P [Formerly PSY-GS 361-P]. Seminar in Cognitive Development. Major theoretical and conceptual issues in cognitive development. Emphasis in current research topics like memory development, reading, conceptual development, semantic development, problem solving, and reasoning. Recommended background: 352P and/or 360P.

C. Other

NURO 8330 [Formerly NURO 330]. Cognitive Neuroscience. This course provides a broad understanding of the state of our knowledge in cognitive neuroscience. The emphasis is on the findings and concepts in the major branches of cognitive neuroscience, rather than techniques (although these will be discussed). The level of analysis will focus on human and non-human primate systems. Prerequisite: an introductory-level undergraduate course in neuroscience or physiological psychology. Basic knowledge of experimental cognitive psychology is desirable but not necessary.
III. Developmental Psychology

A. Psychology (Arts & Science)

PSY 6310-A&S [Formerly PSY 301a-A&S]. Advanced General Psychology (Developmental)

B. Psychology and Human Development (GPC)

PSY-GS 8400-P [Formerly PSY-GS 360-P]. Developmental Psychology. Central issues, theories, and methods.

PSY-GS 8450-P [Formerly PSY-GS 361-P]. Seminar in Cognitive Development. Major theoretical and conceptual issues in cognitive development. Emphasis in current research topics like memory development, reading, conceptual development, semantic development, problem solving, and reasoning. Recommended background: 352P and/or 360P.

PSY-GS 8460-P [Formerly PSY-GS 368-P]. Advanced Seminar in Developmental Psychology. May be repeated with a change of topic.
IV. Neuroscience/Physiological Psychology

A. Psychology (Arts & Science)

PSY 6310-A&S [Formerly PSY 301a-A&S]. Advanced General Psychology (Physiological)

PSY 8906-A&S [Formerly PSY 306-A&S]. Evolutionary Psychology. Interdisciplinary analysis of the origins of mind, with particular emphasis on the mind/brain as a product of biological evolution.

PSY 8216-A&S [Formerly PSY 316-A&S]. Brain Imaging Methods. Principles and methods used in human neuroimaging, with emphasis on functional magnetic resonance imaging (fMRI).

PSY 5780-A&S [Formerly PSY 336-A&S]. The Visual System. (Also listed as Cell and Developmental Biology 8347 [Formerly Also listed as Cell and Developmental Biology 347], Neuroscience 8347 [Formerly Neuroscience 347]) An interdisciplinary approach to how humans see and interpret their visual environment. Topics include the structure of the eye and brain (including optics), the physiology of individual cells and groups of cells, machine vision and models of visual function, visual attention, and mechanisms of complex visual perception. Lectures by faculty from Psychology, Engineering, and Cell and Developmental Biology. Graduate students attend one hour discussion section per week, in addition to lecture, and turn in a more extensive paper than undergraduates.

PSY 8744-A&S [Formerly PSY 344-A&S]. Seminar: Neuroscience

B. Psychology and Human Development (GPC)

PSY-GS 8440-P [Formerly PSY-GS 357-P]. Seminar in Behavioral Biology. Selected topics in behavioral biology—e.g., ethology. Content varies according to student needs and interests. May be repeated. [3]

C. Neuroscience (The Graduate School)

NURO 8324 [Formerly NURO 324]. Advanced Neurophysiology. (Also listed and Advanced Neurophysiology 8323 [Formerly Molecular Physiology and Biophysics 323]) Recent findings concerning the structure, function, and pharmacology of ion channels. Topics will include the relationship between amino acid sequence, protein subunit structure, and function of both voltage- and ligand-gated channels; the relationship between channel structure and pharmacology; the interaction of drugs with channels and receptor/channel proteins, with special emphasis on the interaction of compounds with different functional channel states; indirect coupling between ion channels and neurotransmitter and hormone receptors. Classes will include both presentations by the instructors and discussion of recent publications by students. Prerequisite: consent of instructor.

NURO 8325 [Formerly NURO 325]. Neuroscience Discussions. This two-semester course provides discussions on a broad range of neuroscience topics, ranging from reviews of historical concepts and individuals in neuroscience to science journalism. Other topics include scientific ethics, science policy, good grantsmanship, and communication skills.

NURO 8330 [Formerly NURO 330]. Cognitive Neuroscience. This course provides a broad understanding of the state of our knowledge in cognitive neuroscience. The emphasis is on the
findings and concepts in the major branches of cognitive neuroscience, rather than techniques (although these will be discussed). The level of analysis will focus on human and non-human primate systems. Prerequisite: an introductory-level undergraduate course in neuroscience or physiological psychology. Basic knowledge of experimental cognitive psychology is desirable but not necessary.

**NURO 8340 [Formerly NURO 340]. Fundamentals Neuroscience II.** Required for Neuroscience majors in the Integrative/Cognitive track. Allows students to develop a working knowledge of neural networks and brain systems and the techniques used to study these functions. Includes an introductory overview of neuroanatomy, physiology, and behavior, and then moves on to the sensory and motor systems, motivation, and learning and memory.

**NURO 8345 [Formerly NURO 345]. Fundamentals Neuroscience I.** (Also listed as Cell and Molecular Neuroscience 8345,) [Formerly Molecular Physiology and Biophysics 345] required entry-level course for the Ph.D. in neuroscience and an elective for medical students. Students are exposed to fundamental concepts and techniques in molecular and cellular neuroscience and provided with a theoretical context for experimental analysis of brain function. The course is divided into four modules. Module I: Biophysics and Biochemistry of Synaptic Transmission reviews biophysical and molecular concepts relating to membrane excitability, action potential generation and propagation, and the molecular basis of chemical signaling at synapses. Module II: Synaptic Integration and Plasticity discusses mechanisms and models of synaptic integration and plasticity and concentrates on how molecular changes translate into altered synaptic strength and gene expression programs that underlie short and long-term plasticity. Module III: Neural Development examines historical and current concepts in neural pattern formation, neural migration, axon guidance and synapse formation. Module IV: Neural Diseases and Disease Models focuses on specific brain disorders such as epilepsy, depression, schizophrenia, and Alzheimer’s disease and current models used to investigate their origin and/or treatment. This course combines faculty lecture with discussion of original articles, with an emphasis on student participation.

**NURO 8346 [Formerly NURO 346]. Advanced Molecular Neurobiology.** (Also listed as Advanced Molecular Neurobiology 8346 in Pharmacology [Formerly also listed as Pharmacology 346). This course examines molecular components and interactions that regulate neuronal development, signaling, and disease. Topics include development of neuronal identity, axonal transport, growth factors and cell death, axon guidance and synapse formation, electrical and chemical transmission, regulation of neuronal excitability and genetic analysis of signaling and neural disorders. Didactic and literature discussions provide students with a sound foundation for understanding the molecular bases underlying the development and function of the nervous system. Prerequisite: NURO 8345 [Formerly NURO 345], or consent of instructor.

**D. Neuroscience (College of Arts and Science)**

**NSC 5269 [Formerly NSC 269]. Developmental Neuroscience.** Normal and abnormal brain development. Cell division, migration, and death; synapse formation and plasticity; and clinical syndromes.

**NSC 5272 [Formerly NSC 272]. Structure and Function of the Cerebral Cortex.** (Formerly Psychology 272) Classic and current concepts of cerebral function. Species differences, receptive field organization, neurotransmitters, modifications by experience, and behavioral effects. Prerequisite:

**NSC 5274 [Formerly NSC 274]. Neuroanatomy.** Gross structure, histological architecture, and techniques for creating images of the human brain.
E. Other

**BMW 7440 [formerly BME 331]. Neuroimaging.** Applications of noninvasive imaging techniques including MRI, fMRI, optical, EEG, and PET to the study of neural systems. Emphasis on the human brain, with a focus on current scientific literature. Check with instructor to make sure you have requisite background.

**CS 6350 [formerly CS 350]. Artificial Neural Networks.** Theory and practice of parallel distributed processing methods using networks of neuron-like computational devices. Neurobiological inspirations, attractor networks, correlational and error-correction learning, regularization, unsupervised learning, reinforcement learning, Bayesian and information theoretic approaches, hardware support, and engineering applications.
V. Perception

A. Psychology (Arts & Science)

PSY 6310-A&S [Formerly PSY 301a-A&S]. Advanced General Psychology (Perception)

PSY 5780-A&S [Formerly PSY 336-A&S]. The Visual System. (Also listed as Cell and Developmental Biology 347, Electrical Engineering 351, Neuroscience 347) An interdisciplinary approach to how humans see and interpret their visual environment. Topics include the structure of the eye and brain (including optics), the physiology of individual cells and groups of cells, machine vision and models of visual function, visual attention, and mechanisms of complex visual perception. Lectures by faculty from Psychology, Engineering, and Cell and Developmental Biology. Graduate students attend one hour discussion section per week, in addition to lecture, and turn in a more extensive paper than undergraduates.

PSY 8543-A&S [Formerly PSY 343-A&S]. Seminar: Perception

PSY 8744-A&S [Formerly PSY 344-A&S]: Seminar: Neuroscience - Sem:Neuro of Consciousness
VI. Personality and Individual Differences

A. Psychology and Human Development (GPC)

PSY-GS 8350-P [Formerly PSY 318-P]. Individual Differences. Focuses on traditional concepts and findings in the area of individual differences broadly defined. The psychological content will primarily involve abilities, interests, and personality; methodological issues encountered in assessing these attributes will be stressed throughout; and particular attention will be devoted to how these concepts can enhance research programs in both applied and theoretical areas. The specific variables discussed within each domain will be restricted to those that have empirically “panned out” (viz., variables that are reliable and related to meaningful behaviors and outcomes that psychologists are interested in predicting and better understanding), rather than theoretical constructs and measures whose external validity is unknown.
VII. Quantitative Methods and Evaluation

A. Psychology (Arts & Science)

PSY 8305-A&S [Formerly PSY 305-A&S]. Linear and Nonlinear Mixed Effects Models. The analysis of data from hierarchical and multilevel designs. Theory and computational methods, specification and testing of fixed effects, random effects and residuals, assessment of fit, graphical examination, applications to repeated measures data, and missing data models. Prerequisite: PSY-GS 8861-P (Statistical Inference) [Formerly PSY-GS 310-P] and PSY 6104-A&S (Quantitative Methods and Experimental Design) [Formerly PSY 304B - A&S], PSY-GS 8870-P [Formerly PSY-GS 313-P], or equivalent preparation. Recommended: PSY-GS 8867-P [Formerly PSY-GS 312-P] or equivalent preparation.

PSY 8310-A&S [Formerly PSY 310-A&S]. Research Methods in Clinical Psychology. Major methodological and quantitative issues in clinical psychology, including statistical significance testing and its alternatives; threats to internal and external validity; psychometric theory; quantitative approaches to classification; behavioral, genetic, and psychophysiological methods; animal models; analysis of change, mediation, and moderation.

PSY 8218-A&S [Formerly PSY 318-A&S]. Computational Modeling. Developing and testing computational models of human cognition and brain function. How to implement models, recognize good modeling, fit models to data, evaluate models, contrast competing models, develop and test new models. Discussion of Monte Carlo simulations, statistical numeric methods, and high-performance computing.

B. Psychology and Human Development (GPC)

PSY-GS 8867-P [Formerly PSY 312-P]. Multivariate Statistics. Psychological measurement theory, along with correlational and regression analysis techniques essential to the development of that theory. Prerequisite: PSY-GS 8861-P (Statistical Inference) [Formerly PSY-GS 310-P] and PSY 6104-A&S (Quantitative Methods and Experimental Design) [Formerly PSY 304B - A&S], PSY-GS 8870-P [Formerly PSY-GS 313-P], or equivalent preparation. Recommended: PSY-GS 8867-P [Formerly PSY-GS 312-P] or equivalent preparation.

PSY-GS 8870-P [Formerly PSY-GS 313-P]. Correlation and Regression Theory and practices underlying bivariate and multi-regression/correlation methods. Includes: the full range of correlation and covariance indices; an array of common regression analysis strategies (e.g., reduced-form regression, path analysis, ordered and unordered step-wise inclusion, mediator and moderator models); tests of assumptions and regression diagnostics; nonlinear regression and linearizing transformations; statistical power; and causal analysis with manifest variables. Prerequisite: At least 1 graduate-level statistics course.

PSY-GS 8873-P [Formerly PSY-GS 314-P]. Structural Equation Modeling This course introduces the basic principles of path analysis, confirmatory factor analysis, and latent variable
structural modeling, which constitute a powerful set of statistical tools for examining correlational, observational, and even experimental data in the social sciences. Computer techniques for conducting these analyses will also be taught: the LISREL program in particular, but AMOS will also be introduced. Prerequisite: PSY-GS 8861-P (Statistical Inference) [Formerly PSY-GS 310-P] and PSY 6104-A&S (Quantitative Methods and Experimental Design) [Formerly PSY 304B - A&S]. PSY-GS 8870-P [Formerly PSY-GS 313-P], or equivalent preparation. Recommended: PSY-GS 8867-P [Formerly PSY-GS 312-P] or equivalent preparation. Exploratory Factor analysis.

**PSY-GS 8820-P [Formerly PSY-GS 315-P]. Program Evaluation.** The evaluation of social programs. The design of evaluations to produce both theoretically meaningful and practical information about the program and its effectiveness. Such topics as needs assessment, monitoring, impact assessment, and cost/effectiveness evaluations. Covers programs in education, health, and human services.

**PSY-GS 8876 [Formerly PSY-GS 317-P]. Psychological Measurement.** Fundamental concepts, methods, and principles of psychological measurement. Particular attention will be devoted to reliability and validity issues underlying psychometric theory, and how psychometric theory relates to the assessment of individual differences or human variation more generally. Topics will include multiple regression, factor analysis, and item response theory.
VIII. Social Psychology

A. Psychology (Arts & Science)

PSY 6310-A&S [Formerly PSY 301a-A&S]. Advanced General Psychology (Social Psychology)

PSY 8942-A&S [Formerly PSY 342-A&S]. Seminar: Social

B. Psychology and Human Development (GPC)

PSY-GS 8430-P [Formerly PSY-GS 353-P]. Advanced Seminar: Cognitive Studies. Special topics in cognitive studies, if topic is relevant to social psychology. Permission of W. Smith or C. Smith is required in order for this course to count toward the Social Psychology area requirement

C. Other

LAW 7298 [Formerly LAW 674]. Introduction to Behavioral Law and Economics. This course will explore the basic concepts of the rational-choice framework in economics and then analyze how individuals deviate from the standard assumptions economists make regarding human behavior. Combining empirical and experimental results from both psychology and economics, students will examine the roles that bounded rationality, willpower, and self-interest play in law and economics, and the legal system more broadly, and the consequences of these three departures from neoclassical economics. No previous background in economics is required. [3] NOTE: This course requires completion of a “Request for Graduate Credit” form with the graduate school. If that form is not completed, you will need to paid Law School tuition.

LWEC 8403 [Formerly LWEC 403]. Behavioral Law and Economics I. Economic principles underlying behavioral law and economics research. Analyses of the rationality of individual choice will be undertaken, including research that involves the interaction of economics, psychology, and decision sciences. Applications of behavioral law and economics methods will be applied to the analysis of jury behavior. Pre- or co-requisite: ECON 304A. [3] NOTE: This course can be taken with permission of the instructor without having taken ECON 304A. Some undergraduate coursework in microeconomics is required. This course may also require completion of a “Request for Graduate Credit” form depending on whether it is listed as a Law course or an Economics course.

LWEC 8404 [Formerly LWEC 404]. Behavioral Law and Economics II. Research contributions at the frontier of behavioral law and economics research. Each student will structure a controlled experiment to test the rationality of jury behavior, the effect of alternative jury instructions, or a similar kind of scientifically controlled study of behavior relating to the performance of the legal system. Students will administer and analyze the survey results and will prepare an original research paper on their chosen topic. Pre-requisite: LWEC 403. [3] NOTE: This course may also require completion of a “Request for Graduate Credit” form depending on whether it is listed as a Law course or an Economics course.
Appendix B: List of Courses that Fulfill American Psychological Association (APA) Distributional Requirements

Note: These requirements only apply to Clinical Science students and are discussed on page 8.

I. Biological Aspects of Behavior

A. Psychology (Arts & Science)

PSY 6310-A&S [Formerly PSY 301a-A&S]. Advanced General Psychology (Physiological)

PSY 8744-A&S [Formerly PSY 344-A&S]. Seminar: Neuroscience

PSY 8758-A&S [Formerly PSY 358-A&S]. Seminar in Neuroscience. Integration of the subareas of neuroscience (enrollment for two semesters is required).

B. Psychology and Human Development (GPC)

PSY-GS 8440-P [Formerly PSY-GS 357-P]. Seminar in Behavioral Biology. Selected topics in behavioral biology—e.g., ethology. Content varies according to student needs and interests.

II. Cognitive and Affective Aspects of Behavior

A. Psychology (Arts & Science)

PSY 6310-A&S [Formerly PSY 301a-A&S]. Advanced General Psychology (Cognitive)

PSY 8503-A&S [Formerly PSY 303-A&S]. Models of Human Memory. Survey of contemporary models of human memory, especially formal models. Methods of fitting models to data will be discussed. Prerequisite: graduate course on cognition.

PSY 8352-A&S [Formerly PSY 352-A&S]. Seminar: Clinical Psychology (various topics)

PSY 8557-A&S [Formerly PSY 357-A&S]. Seminar in Cognitive Science. Integration of the subareas of cognitive science (enrollment for two semesters is required).

B. Psychology and Human Development (GPC)

PSY-GS 8450-P [Formerly PSY 361-P]. Seminar in Cognitive Development. Major theoretical and conceptual issues in cognitive development. Emphasis in current research topics like memory development, reading, conceptual development, semantic development, problem solving, and reasoning. Recommended background: 352P and/or 360P.

III. Social Aspects of Behavior

A. Psychology (Arts & Science)

PSY 6310-A&S [Formerly PSY 301a-A&S]. Advanced General Psychology (Social Psychology)

PSY 8942-A&S [Formerly PSY 342-A&S]. Seminar: Social

B. Psychology and Human Development (GPC)

IV. Individual Differences in Behavior

A. Psychology (Arts & Science)

PSY 8312-A&S [Formerly PSY 312-A&S]. Psychological Assessment. Major techniques of psychological assessment, with an emphasis on the rationale, administration, and interpretation of measures assessing personality and psychopathology

B. Psychology and Human Development (GPC)

PSY-GS 8350-P [Formerly PSY-GS 318-P]. Individual Differences. Focuses on traditional concepts and findings in the area of individual differences broadly defined. The psychological content will primarily involve abilities, interests, and personality; methodological issues encountered in assessing these attributes will be stressed throughout; and particular attention will be devoted to how these concepts can enhance research programs in both applied and theoretical areas. The specific variables discussed within each domain will be restricted to those that have empirically “panned out” (viz., variables that are reliable and related to meaningful behaviors and outcomes that psychologists are interested in predicting and better understanding), rather than theoretical constructs and measures whose external validity is unknown.

V. History and Systems of Psychology

History and systems of psychology is covered via an infusion approach such that relevant material is covered in a dedicated and integrated manner with the course content of a number of core courses (PSY 8310-A&S [Formerly PSY 310-A&S], PSY-GS 8876-P [Formerly PSY-GS 317-P], PSY-GS 8300-P [Formerly PSY-GS 343-P], PSY 8354-A&S[Formerly PSY 354-A&S]), research seminars (PSY-GS 8420-P [Formerly PSY-GS 349-P], PSY 8360-A&S[Formerly PSY 360-A&S]), and electives (e.g., PSY-GS 8500-P [Formerly PSY-GS 396-P]).

VI. Psychological Measurement
Psychological measurement is covered by the required course in psychological measurement (PSY-GS 8876-P) [Formerly PSY-GS 317-P]:

**PSY-GS 8876-P [Formerly PSY-GS 317-P]. Psychological Measurement.** Fundamental concepts, methods, and principles of psychological measurement. Particular attention will be devoted to reliability and validity issues underlying psychometric theory, and how psychometric theory relates to the assessment of individual differences or human variation more generally. Topics will include multiple regression, factor analysis, and item response theory.

In addition, psychological measurement is covered by the required classes in assessment (PSY 8312-A&S, PSY-GS 8300-P, and/or PSY 8354- A&S). [Formerly PSY 312-A&S, PSY-GS 343-P, and/or PSY 354-A&S]

**VII. Research Methodology**
This requirement is fulfilled by the required course on research methods in clinical psychology (PSY 8310-A&S) [Formerly PSY 310-A&S]:

**PSY 8310-A&S [Formerly PSY 310-A&S]. Research Methods in Clinical Psychology.** Major methodological and quantitative issues in clinical psychology, including statistical significance testing and its alternatives; threats to internal and external validity; psychometric theory; quantitative approaches to classification; behavioral, genetic, and psychophysiological methods; animal models; analysis of change, mediation, and moderation.

For additional training, students can enroll in several other research methods classes offered by Psychological Sciences faculty (Research Methods in Developmental Psychology (PSY-GS 8815-P [Formerly PSY-GS 303-P]),

**VIII. Techniques of Data Analysis**
This requirements is fulfilled by the required first-year statistics sequence (PSY-GS 8861-P [Formerly PSY-GS 310-P] and PSY 6104-A&S [Formerly PSY 304B-A&S]

**PSY-GS 8861-P [Formerly PSY-GS 310-P]. Statistical Inference.** Introductory course designed to familiarize doctoral students with the principles and procedures of statistical inference and to prepare them for more advanced work in research design and analysis

**PSY 6104-A&S [Formerly PSY 304b-A&S]. Quantitative Methods and Experimental Design.** Principles of experimental design and descriptive and inferential statistics.

For additional training, students can enroll in courses offered by the Quantitative Methods and Evaluation (QME) area group. See the listing of QME classes on pp.40-41.
