

# Alzheimer's Disease

Timothy J. Hohman, PhD  
Assistant Professor of Neurology  
Vanderbilt Memory & Alzheimer's Center

Osher Lifelong Learning Institute  
*October 11, 2018*

- Alzheimer's Disease Background and Epidemiology
- Biology and Biomarkers of Alzheimer's Disease
- Genetics of Alzheimer's Disease
- Initiatives at Vanderbilt Memory & Alzheimer's Center

# Alzheimer's Disease

- First described by Alois Alzheimer in 1908
- A diagnosis of Probable AD requires
  - Functional Impairment
  - Cognitive Impairment in at least 2 domains
  - Both must represent decline from previous levels
    - “Insidious onset” – symptoms are gradual rather than sudden
  - Not due to delirium or neuropsychiatric condition
  - Not due to other cerebrovascular or neural injury

# Alzheimer's disease symptoms

- Typically amnestic presentation
  - Primary impairment in learning and recall of recent information
- Can have non-amnestic presentations
  - Language, visuospatial, executive dysfunction
- Functional deficits
  - Handling finances, driving, bathing, dressing
- Personality and mood changes
  - Confusion, aggression, depression
  - *Makes diagnosis challenging!*

# Alzheimer's Disease v. Age-Related Change

Signs of Alzheimer's/dementia	Typical age-related changes
Poor judgment and decision-making	Making a bad decision once in a while
Inability to manage a budget	Missing a monthly payment
Losing track of the date or the season	Forgetting which day it is and remembering it later
Difficulty having a conversation	Sometimes forgetting which word to use
Misplacing things and being unable to retrace steps to find them	Losing things from time to time

# Alzheimer's Disease Prevalence

Prevalence of AD increases with age

- 3% of people age 65-74
- 17% of people age 75-84

# Alzheimer's Disease Prevalence

Prevalence of AD increases with age

- 3% of people age 65-74
- 17% of people age 75-84
- 32% of people age 85+

Ages of People with Alzheimer's Dementia  
in the United States, 2017

- 85+ years, 38%
- 75-84 years, 44%
- 65-74 years, 16%
- <65 years, 4%

Created from data from Hebert et al.<sup>A4, 31</sup>

Percentages do not total 100 because of rounding.

Alzheimer's Association,  
2013 Alzheimer's Disease Facts & Figures  
Alzheimer's & Dementia, 9(2).

# Alzheimer's Disease Projections

- 4.7 million cases of Late Onset Alzheimer's Disease (LOAD) in 2010
- 13.8 million cases by 2050
- Cost \$203 Billion in 2012
- Estimated to reach  
**\$1.2 trillion by 2050**

Total cost: \$203 Billion (B)

Hebert et al., 2013

\*Data are in 2013 dollars.

Alzheimer's Association,  
2013 Alzheimer's Disease Facts and Figures  
*Alzheimer's & Dementia*, 9(2).

# Sex Differences in Alzheimer's Disease

- Almost two-thirds of AD cases in the US are **women**

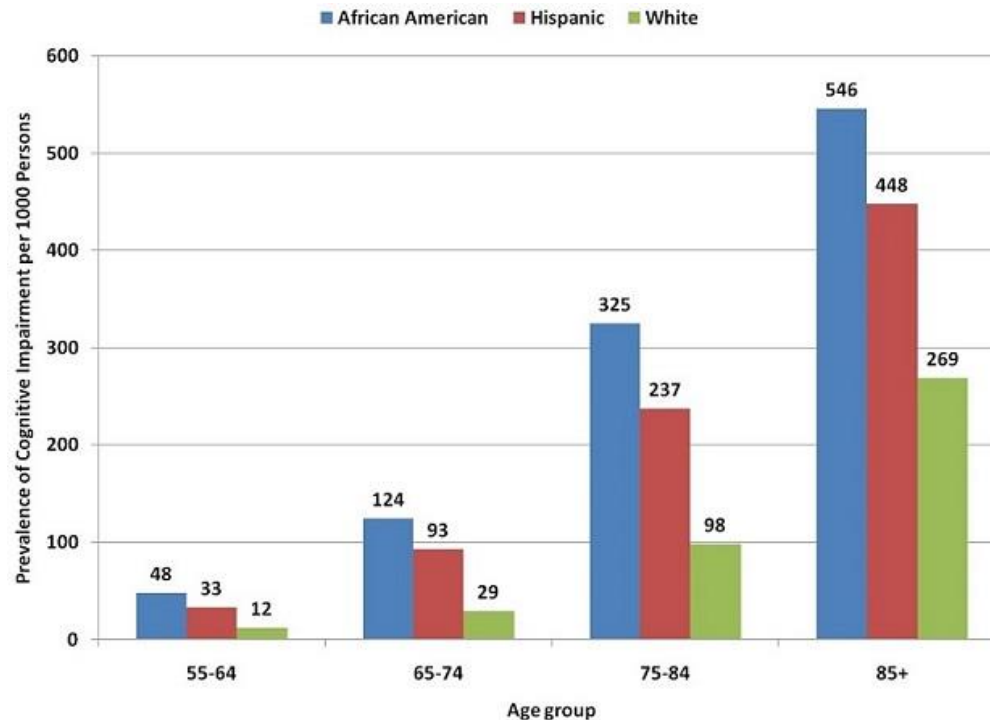

Estimated Lifetime Risk for Alzheimer's Dementia,  
by Sex, at Age 45 and Age 65

Created from data from Chene et al.<sup>160</sup>

# Racial/Ethnic Differences in AD

- Compared to older white individuals
  - **African Americans** are ~2x more likely to have AD
  - **Hispanics** are ~1.5x more likely to have AD

# Racial/Ethnic Differences in AD

## Disparities Increase with Age

- 6 racial/ethnic groups
- 274,000+ members of Kaiser Permanente
  - a large, integrated healthcare delivery system in Northern California
- Used electronic health records from 2000 to 2013

### First Study of Dementia Risk in a Population Representative of the diversity in the US

# Costs of Health Care

- African-Americans elders had significantly higher costs of care than whites or Hispanics
  - primarily due to more inpatient care and more comorbidities.

Average Annual Per-Person Payments by Type of Service and Race/Ethnicity for Medicare Beneficiaries Age 65 and Older, with and without Alzheimer's or Other Dementias, 2014, in 2016 Dollars

	Total Medicare Payments per Person	Hospital Care	Physician Care	Skilled Nursing Facility Care	Home Health Care	Hospice Care
White	\$19,734	\$5,163	\$1,611	\$3,367	\$1,695	\$3,128
African-American	26,686	8,690	2,185	4,174	2,072	2,316
Hispanic	21,151	6,986	1,900	3,209	1,787	1,724
Other	25,675	7,858	2,137	3,362	3,671	2,549

Created from unpublished data from the National 5% Sample Medicare Fee-for-Service Beneficiaries for 2014.<sup>188</sup>

# Summary

- AD includes functional and cognitive deficits
- Risk of AD increases with age
- Females are at higher risk of AD than males
- Lower SES and Education are associated with higher risk
- African Americans and Hispanics populations are at higher risk than Caucasians and Asians
- These disparities increase over the lifespan

# Genetics of AD: Past

- Early Onset Alzheimer's Disease (EOAD)
  - Before the age of 65
  - Dominantly inherited
  - ~1% of AD Cases
  - *APP*
    - *Amyloid Precursor Protein: Membrane Protein at Synapse*
    - *Mutations result in  $\uparrow A\beta$  Production*
  - *PSEN1*
    - *Gamma Secretase: APP Cleavage resulting in  $\uparrow A\beta$  Production*
  - *PSEN2*
    - *Gamma Secretase: APP Cleavage resulting in  $\uparrow A\beta$  Production*

# Genetics of AD: Past

- Early Onset Alzheimer's

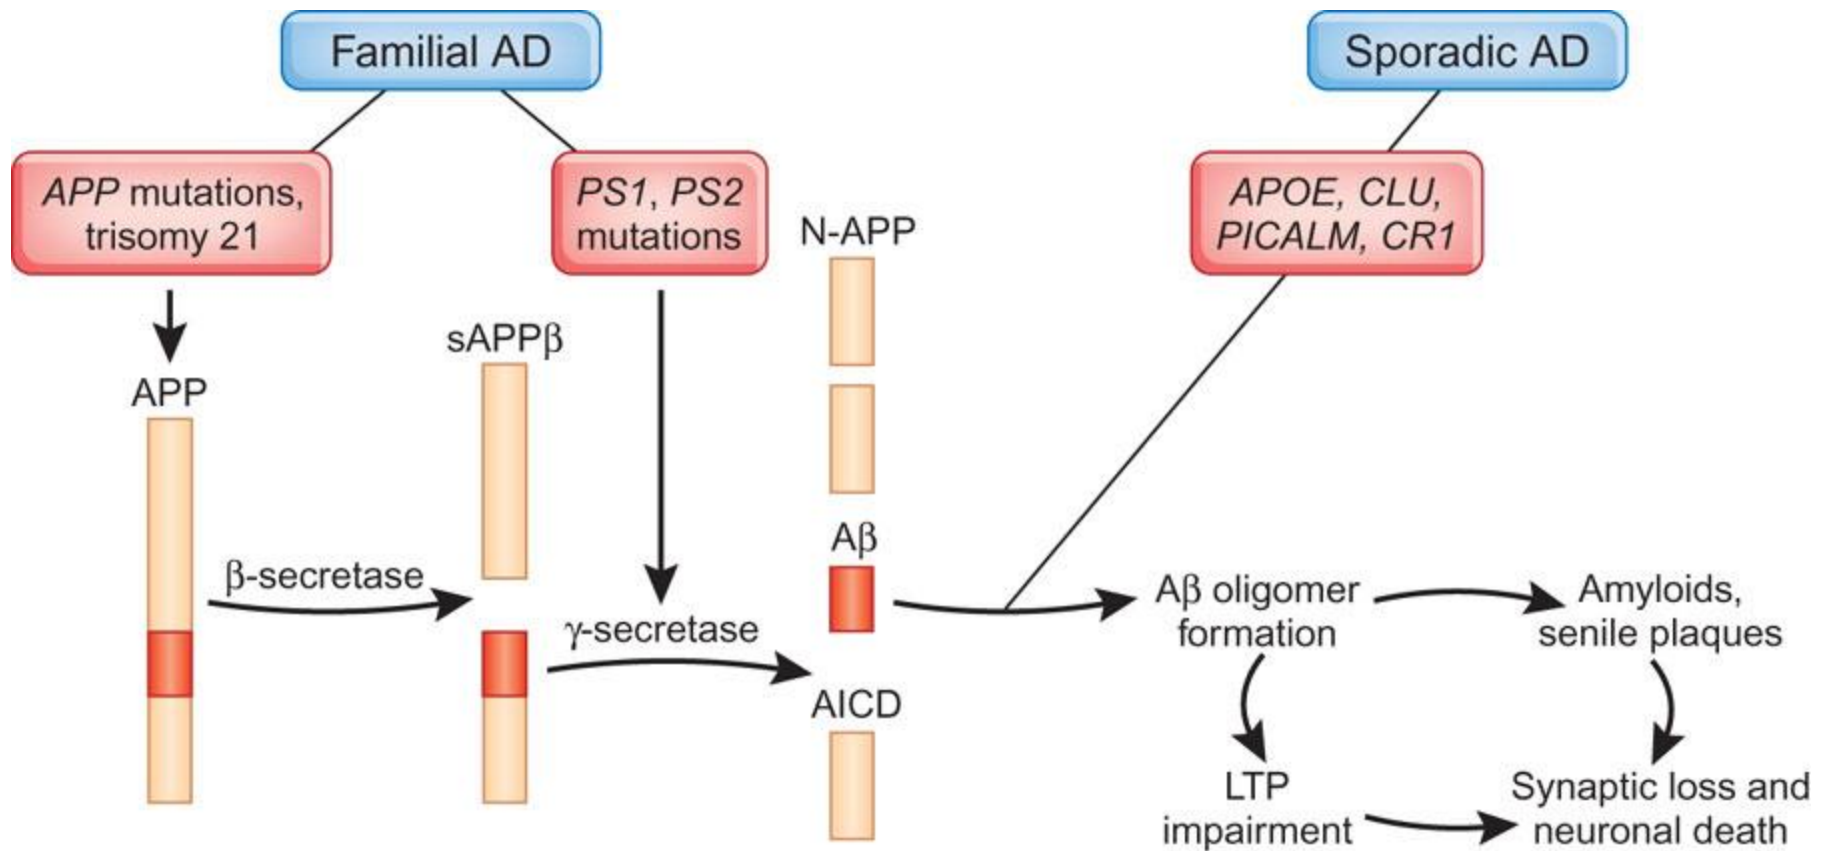

# Genetics of AD: Past

- Late Onset Alzheimer's Disease (LOAD)
  - Heritability estimated between 60-80% (Gatz et al., 2006)
  - Known loci explain ~25% of heritability (Hon-Cheong et al, 2011)
  - *APOE*
    - $\epsilon 4$  dose dependent effect (Corder et al, 1993)
    - Mechanism unknown
    - OR = 3.68
    - $\epsilon 2$  protective effect
  - Other loci
    - *BIN1, CLU, ABCA7, CR1, PICALM, MS4A6A, CD33, MS4A4E, CD2AP, EPHA1* (alzgene.org)
    - Odds ratios between .85 and 1.25

# Genetics of AD: Past

- Early Onset Alzheimer's and Late Onset Alzheimer's

# Apolipoprotein E

- Structure (299 amino acids)
  - Polymorphic, differs at position 112 and 158
    - E3 – cys112(-), arg158(+)
      - Common, normal function
    - E4 – arg112 (+), arg158(+)
      - Preferentially binds large lower-density lipoproteins
      - Positive charge at 112 leads to conformation change in N-terminal and an interaction between N and C terminal
        - » Interacts with Glu255 (residue), preferential binding reverts when glutamine is changed to alanine.
    - E2 – cys112(-), cys158(-)
      - Alters conformation, reducing ability to interact with Low-Density Lipoprotein (LDL) receptor
  - Implications
    - E4 is less stable, E2 is extremely stable (2 state equilibrium)
    - Increases likelihood of binding larger lipoproteins
    - Little is known about how these structural differences alter binding potential for lipid-bound APOE molecules
- Observed effects of E4
  - Associated with enhanced inflammatory response
  - Amyloid clearance (released from astroglia)
  - Associated with higher levels of plaques and tangles post-mortem and in vivo
  - May regulate tau phosphorylation via GSK-3 through interaction with LRP5 and LRP6
